THE AMERICAN FLORIST.

VOLUME VII.

August 13, 1891 to August 4, 1892.

CONTENTS.

Illustrations are indicated by an *

A

Abelia floribunda (Telephone)..... 208
Abutilon Eclipse 1105
Acanthophoenix crinita..... 403
Acanthorhiza aculeata..... 463
Acer spicatum 1050
Achyranthes, Propagating..... 634
Acorus Japonicus var.....1163
*Administration Building at World's Fair 167
Adiantum Capillus veneris.....540 659
Adiantum cuneatum.....1105
Advertising the exhibitions.. 262
Afraid to tell the truth.....252, 305 327
*Agave Americana in bloom 503
*Agricultural Building at World's Fair..... 285
Allamandas 1064
*Alocasia Sanderiana 209
Alsophilas 523
Alternantheras, Propagating..... 633
American Carnation Society..136, 192 230
American Carnation Society meeting..... 583
American Pomological Society..... 198
Am. Seed Trade Ass'n—Meeting of Executive Committee 510
Amaryllises 1104
Anemones, Japan 227
Anderson, Charles P.—obituary..... 148
*Angræcum sesquipedale..... 830
Annuals, New..... 64
Annuals, Recent improvements in.. 252
Anthericum liliastrum major..... 260
Ants 648, 650 745
Aphelandra aurantiaca Roezlii 540
Aphelandras 610
Aponogeton distachyon..... 461
Aponogeton fenestralis..... 520
Aquatics.....81, 205 231
Aquatics, How I grow them..... 280
Aquatics in the west..... 102
Aquatics, New..... 64
*Aquatics, Pond of at Lincoln Park, Chicago 205 2.7
*Aralia papyrifera..... 284
Aralia spinosa 1169
Araucarias 423
Arbutus unedo..... 540
Arduina spinosa..... 539
Areca lutescens..... 860
Arlington, Va..... 196
Arnold Arboretum, Notes from 1049, 1069
*Arrangement of plants in large conservatories 184
Artistic grouping of flowers, The .103 251
*Art Palace at World's Fair 883
*Asparagus, House of..... 985
Asparagus plumosus nanus 612
Asters 631
Asters, Fine— 144
Astilbe Japonica compacta multiflora 1066
Astrocaryums 463
Asystasia scandens..... 540
Atlanta convention, The....936, 1002, 1029
Aucuba Japonica 208
*Augustine, H 1109
Avoid the rush..... 238
Azaleas 660
Azaleas for forcing..... 44
Azalea notes 920
Azaleas (Telephone)..... 380

B

*Ball, Chas. D..... 667
Balsam firs 1069
Baltimore....591, 614, 639, 682, 711, 733, 758, 785, 813, 834, 857, 880, 914, 930, 970, 984, 1005, 1026, 1048, 1067, 1108, 1126, 1148, 1167
*Bamboos, Tokio, Japan.....1027
*Banquet, A..... 120 125
Barbary thorn 461
*Barnard, W. W 667
*Basket of orchids..... 145
*Bayersdorfer, Harry..... 669
Bedding, Bits of seen lately.....1024
Bedding plants..... 176
Bedding and vase plants.....1044
Bedding plants, Growing in large quantities..... 633
Bedding trade, Notes from 900
Beech, The tricolor..... 1104
*Begonia Baumanni..... 561
Begonia coralina..... 611
Begonia Credneri 631
Begonia fulgens..... 482
Begonia glaucophylla scandens. 1164
Begonias, New..... 44
Begonia semperfl. atropurpurea..... 631
Begonias, Sweet scented 442 496
*Begonia Thurstonii 728
*Begonia Vernon (Semp. Atropur.). 543
Benches, Preserving 391
*Berger, Mrs. H. H..... 665
*Berkowitz, Paul 669
Berkshire County, Mass.....1146
Berry bearing plants..... 260
Berry wreaths 434
Bignonia venusta..... 520
Black aphis on alyssum..... 598
*Blanc, A..... 670
*Blish, Frank Dan 671
Bocconia Japonica.....1145
Boehmeria nivea 269
Boston....6, 23, 70, 86, 99, 106, 128, 146, 192, 211, 233, 259, 283, 306, 328, 332, 345, 364, 384, 404, 424, 444, 464, 483, 505, 523, 545, 567, 591, 614, 638, 670, 711, 731, 758, 784, 811, 832, 857, 880, 904, 905, 926, 958, 982, 1007, 1024, 1046, 1066, 1087, 1106, 1124, 1149, 1165.
*Bouquets, Market..... 146
Bowling match, A 1048
*Bowling prize at Toronto..... 22
*Bowling trophies, The.....1147
*Brague, L. B..... 670
Bridgeport, Conn 134
Browallia Linneana 631
Buffalo....18, 98, 222, 464, 505, 524, 569, 615, 720, 734, 812, 834, 880, 930, 958, 1016, 1027, 1048, 1068, 1120, 1125, 1168.
Buffalo show, Receipts at..... 844
Bulbs, Dutch, Growing in America .. 828
*Bulbs, Sizes of..... 1167
Bulb, Forcing industry..... ... 1134, 1174
Bulbous plants..... 44
Burgess, Robt. J.—obituary 600
*Burns, Alex 779
Butted glass..... 474

C

*Cactus bed.....1086
Calampelis scabra var. roseus 876
Calanthes..... 634
Calanthes as florists' flowers..... 138
Callas, Frozen.....190 692
Callas not edible (Telephone) 209

Trade Training.

[In the following extracts from a paper read before the National Association of Builders, by Col. R. T. Auchmutz, of New York, there are suggestions for the Society of American Florists. Can not we, through our national society, establish a florists' apprentice school?]

GENTLEMEN:—However desirable it may be that there should be a wide acquaintance among those who follow the same callings, however pleasant the annual meetings of this organization may be, particularly when hospitality is so thoughtfully and lavishly offered as it is here, it is not for social purposes that these conventions of the National Association of Builders are held. Neither do you come together to consider how work can best be done. Valuable essays may be read, but the discussion of such subjects can wisely be left to the local organizations or to the columns of the trade papers.

You have come from all parts of the United States to consider such matters as pertain to the conduct of your business, and which can only be determined by concerted action. Such subjects as the position you are to hold to those who employ you and to those you employ; the best means of guarding against unfair dealing or against such competition as, under the guise of reducing the cost, lowers the standard of workmanship; the establishment of a regular form of contract and providing for a specification which conveys the same idea to all who work by it, and, far from least in importance, the best method of training the youth of this country in the mechanic arts, these subjects concern you all. In dealing with them as individuals you can do little, while dealing with them as an association all that is reasonable and just can be accomplished.

At meetings, then, held by business men for business purposes, those who speak should discard theory and confine themselves to what they know. I have been invited to come here today to give my views on training young men so that they can not only become mechanics, but mechanics worthy of this country. This invitation has been extended to me because it has been my fortune—and I use that word designedly, for I consider it has been a privilege rather than a task to have rendered aid to the class of young men who have sought my help—because it has been my fortune, I say, to have given instruction in the building trades to nearly two thousand young men. I have heard their needs when they came to my schools, watched their progress while they were there and endeavored to ascertain their success after they left. One must be dull indeed who had observed nothing or gained no experience during seven years passed in such a work.

WHO ARE OUR MECHANICS?

Let us see who now do the skilled work of this country. In the building trades we have mechanics from England, Ireland, France, Italy and Germany, and we have mechanics who are our own countrymen. Each nationality usually follows some particular trade. In New York, for instance, the stone-masonry is mostly done by the sons of Italy; Englishmen and Irishmen lay the brick. When the heavy work of putting on the beams, or of framing and placing in position the roof trusses, begins, seldom an English word is spoken; the broad shoulders and brawny muscles of the German furnish the motive power. Irishmen and Americans in about equal numbers do the carpenter's work. In the plumbing trade, where science is as needful as skill—thanks, perhaps, to the interest the master plumbers have taken in the plumbing school—our own countrymen will soon have control. Where delicate artistic work is required, we find the Frenchman and the German. In all the trades, except the plumbing, we find that the best workmen, those who command the steadiest employment, are of foreign birth.

THE APPRENTICE.

If we see but few American mechanics at work on the buildings in our large cities, still smaller is the number of boys who are learning their trade. Those who are to fill the vacant places are learning how to work in other lands or in country towns. The 'prentice boy was once a feature in city life. Strict rules were enforced by trade associations in regard to him, which were intended to make sure he became a skillful workman. Equally strict rules are now enforced, but they are devised not to make the lad a good workmen, but to keep him out of the trades.

I need not take your time in giving a history of apprenticeship. As a system it has passed away, and, to quote from the report on apprenticeship adopted at your last convention, "there is no encouragement for its revival." The old system ceased to exist, it became impossible, when the master mechanic ceased to work with his men and when modern methods of conducting business required that labor should be subdivided. Then not only was the apprentice deprived of the personal care of his master, but the workshop ceased to be a place in which a trade could be thoroughly acquired. So important is it in a well-conducted work-shop that each workman should be kept at what he can do best, that it has come to be recognized that the larger the workshop the less chance the boy has of learning a trade in all its parts. There are workshops where, as in the Baltimore & Ohio R. R. Co.'s shops in Baltimore, a capable instructor is appointed to look after the lads, to see that they pass

through each branch of the trade they are learning and to explain to them details that otherwise would be difficult of comprehension; but such a plan would not be practical on account of its expense in the average shop.

In modern times has grown up the custom of hiring a boy to make himself useful, with the understanding that he is to learn his trade in part payment for his services, by observation and by such practice as he can get. A bright boy, if he happens to meet with a kind foreman and friendly journeymen, may learn a great deal in this way, but the chances are that he will be employed on what he can do best, and that he will not be allowed to injure tools or waste material in trying his hands on difficult work. If the surroundings were favorable the lad might become a good workman when his "time" was served; if unfavorable, he might waste four precious years, and not only not be a good mechanic, but be unfitted for any other occupation. Chance should form no part in an educational scheme, certainly not in an industrial educational system. All that the lad is likely to have with which to fight the battle of life, when he becomes a man, is his skil!; its acquirement should not be a matter of chance.

HOW TO ESTABLISH TRADE SCHOOLS.

The establishment of a trade school need not be looked upon as either difficult or expensive. Some unoccupied workshop or some vacant plot of land on which temporary buildings could be erected would give shelter. A committe appointed by the Master Builders' Association of three members for each of the trades in which instruction is given could manage the school.

I would advise that not more than two or three trades be taught at first. Bricklaying, plastering and carpentry produce the speediest results. Instruction in plumbing is of the utmost importance in large cities; but I doubt the expediency of starting plumbing schools in small towns. It will not be necessary to raise much money. After shelter has been provided, two or three thousand dollars will equip the school and meet the first demands. Such an amount could be easily raised. The Merchant Tailors' Society of New York raised $7,300 in a few days to maintain a tailoring class in my schools.

The fee should meet the running expenses, for when once it is known that the trade school is the entrance gate to the building trades, any reasonable fee required to cover the expenses will be readily paid. It is better for the young men that they should pay the cost of their instruction. Except in the case of the helpless, charity is misplaced and demoralizing. The evening bricklaying class at the New York Trade Schools will pay expenses with seventy-five members at $20 each. The cost of instruction and the waste of material in the day plumbing class, with fifty pupils, at $35 dollars each, and in the evening class, with one hundred pupils, at $12 each, will be met. A fee of $12, with twenty-five pupils, will cover the cost of the evening stone-cutting class, and $16, with forty pupils, the cost of the classes in carpentry and plastering. In addition to the expenses of each class, there must be a considerable outlay for salary of clerk and janitor, for the cost of fire, lights, printing, etc., but a very moderate increase of the fees charged at my schools would also meet these expenses and make the schools self-supporting. I cannot make too plain the fact that the young men do not want charity, but that they will gladly pay whatever is reasonable, and will save up their money for that purpose, provided they feel sure that after they have finished their training they shall be at liberty to dispose of their labor for what it is worth, and that they shall have the same right as is accorded to the immigrant when he leaves Castle Garden. Once this right is recognized, all that associations of master mechanics need do will be to hold examations and give advice. Private liberality, which in this country is ever ready to help any good work, or private enterprise, as was the case with business colleges, will do the rest.

WELL-EDUCATED YOUNG MEN WANTED IN THE TRADES.

I do not think too much attention can be given to the class of young men from whom the trades are to be recruited. Young men are wanted in the trades who have been carefully brought up, who have had a high school or even a scientific-school education. The system adopted by your association will give such young men a chance to become mechanics. Heretofore a lad who wished to learn a trade must leave school at fourteen or fifteen—at just the age he should be there. Years that would be precious at school must be passed in running errands and doing work but remotely connected with learning a trade. Respectable, well-to-do parents would naturally prefer that their sons should remain at school. It has come to be thought by the public that a mechanic does not need much education. It is said that a young man who has had a high-school education is lost to the trades; rather might it be said that the trades have heretofore excluded such young men. Master mechanics send their sons to the New York Trade Schools from all parts of the United States. They wish them to be mechanics, but they also intend they shall first have had what all Americans need, a good education, which, if they entered the shops as boys, they could not get. If an errand boy is wanted, hire one; teach him a trade, help him when he has learned it; but do not say that none but errand boys shall become mechanics. If labor is to be held in honor, it must be educated labor. A calling is regarded according to the education of those who follow it. The man makes the calling far more respectable than the calling dignifies the man. The author of the "Bread Winners" describes the secret anger of a carpenter who was not spoken to or even noticed by the rich man in whose library he was working. The employer in this case was not a purse-proud man, he had inherited his wealth, he had been a soldier in the war for the union, he was devoting his life to the benefit of his fellow-men, he meant no disrespect, but he supposed that there was nothing in common between the mechanic and himself. If a clerk had entered the same room, who worked, perhaps, for less than half the wages the carpenter earned, he would have met with a courteous reception, as it would have been assumed that he was an educated man. This is a supposititous case, but I ask if it is an exaggerated one. In looking back over your own lives, if you, as some of you probably did, commenced your life's work when you were lads, I think it will be found that you were advanced to be foreman, that you struck out for yourselves as master mechanics, not only because you may have been good workmen, but also because your parents gave you a good education.

Tree Ferns.

Among ferns the "tree" forms are of course the monarchs. It is remarkable, the difference between Hymenophyllum bivalve, growing not higher than four inches, and Dicksonia antarctica, here illustrated, which has tree-like stems often more than twenty feet high, and with spreading fronds making a head fully twenty feet in diameter. They are both natives of New Zealand and grow in close proximity. In the coal fields of Pennsylvania fossil specimens are found that are nearly identical with Dicksonia antarctica. The illustration is of a plant shown by Pitcher & Manda at the late New York show. JOHN THORPE.

New York.

"Wherein can the club benefit the trade?" is the question that is now being discussed by the New York Florists' Club.

At the July meeting Mr. C. B. Weathered opened the subject in an essay in which he advocated the opening of a club room to be used as headquarters for the members of the trade and also as an exchange, upon the same principle as the Dry Goods Merchants', Hatters' and other trade clubs.

At the August meeting of the Club, Mr. John N. May, read an essay supplemental to that presented at the previous meeting, and which he gave the title "A Realization," Mr. Weathered having spoken of his own essay as "a dream."

Mr. May's essay follows:

"We all of us feel after having a pleasant dream that if it would materialize how much it would add to our happiness and to that of many of our fellow beings also. The same may be said of the dream of Mr. Weathered, which he very pleasantly related to us at the last meeting of this Club. Now if his dream can only be made to materialize what a pleasant thing it would be for this body of florists. A home! What volumes are conveyed in that little word! The first great aim of every man, having the slightest respect for himself, is to acquire a home. Whether he be the poorest laborer or the wealthiest merchant prince his one great aim is to have a home of his own. This is the place where he goes to rest after the toil and worry of the day's business is over; but there is also another kind of a home beside the domestic one, and that is the business home. This nearly every kind of business in the civilized world has or is striving to obtain. Look at the cotton, corn, coal, iron, cattle, meat, fruit and woolen exchanges, and dozens of others representing almost every branch of industry. What are they but business homes where the men engaged in either can go to meet his fellow men engaged in the same line of business? These men do not join these homes simply to go there and kill time, on the contrary they do so because they find they can conduct their business much better and more profitably by associating freely with as many as possible engaged in the same line of business as themselves, for by doing so they become much better acquainted with the state of trade, its requirements, new ideas, etc., which are ever changing, and by embracing these he improves his chances of success. But, notwithstanding the long list of trade homes, the florists have not even the vestige of one. Nowhere in this great city can we find the slightest sign of a florists' home! Why is this? Is it because our business is such that we have no interest in common with our fellows, or is it because isolation is advantageous to our business, or shall we injure ourselves by associating with our fellow business men? Really it would

DICKSONIA ANTARTICA.

look as if it must be so—that A is afraid B will have eight or ten more "Perles" than he; or C thinks that D will cut twelve more "Valley" than himself. Perhaps if E is not very careful F will get one cent a dozen more for his Bermudas than himself, therefore it will never do for him to let F know anything about what he is doing. These and hundreds of other kindred subjects, are, in the minds of many of us, just and sufficient reasons why we should not meet and talk business matters over—as other trades do—because if we should do that it is just possible Jones may hear that Brown has some fine palms for sale and offer five cents each more for them than Smith is giving for them, and if Brown accepts the advanced price it will be injurious to his trade or he will get rich too fast at such high prices realized for his goods in open market.

"A vision of the future, my friends, will, perhaps, show the fallacy of this narrow-minded policy in all its absurdity. This simple flower before you embodies in itself harmony, grace, elegance and refinement. Its first sentiment is our great teacher, at whose door we should learn the true lesson of life, which is that the man who lives for self, and self alone is and ever will be a narrow-minded egotist, grinding the knife that will cut his own throat. This vision shows us that our business should and does teach us better things. Flowers, the most beautiful of all of Nature's creations are the foundation, corner stone and pinnacle of our business. To diffuse the love of flowers in every way possible is the only possible way to improve our business. Can we do this by isolation? Emphatically NO! But by co-operation we can do very much.

"When we carefully consider this matter it seems surprising that we have not yet roused from our first sleep enough to see that a business in which the goods are so perishable as ours, is, and must necessarily be one demanding that our goods be put before the public in the best and quickest way possible. The man growing pinks only stands but a very poor chance of having his flowers presented to the public at their best without the assistance of the fern and smilax grower, etc. The same law governs the whole line of our business. Are we not then mutually benefited by the success of our neighbors? Would it not be a benefit to the rose-grower if there were nothing but first-class flowers ever sent to the New York market? Then living prices could be asked, yes, and obtained, for every flower sent in, and the trade would be in every way benefited thereby. As it is thousands upon thousands of roses alone are sacrificed, and many growers who under the present rule of "sell-at-anything-you-can-get-for-them" are struggling under a heavier load of debts this year than ever before and they will continue to do so just as long as things remain in their present state.

"Perhaps the very pertinent question will be asked, 'how can it be changed?' By all the rose-growers meeting in their home and thoroughly discussing the matter on all its various sides; thereby agreeing not to send anything but A1 quality flowers to market, and for those to accept only a fair and reasonable price. It simply requires a little mutual assistance from all concerned to carry out such an arrangement, which in the very near future would be a very great benefit to the growers, they having received a fair return for their labor, the sellers because the goods being all of uniformly good quality sold much better and easier; the consumers because they got a better equivalent for their money; they are thereby induced to buy more largely.

"As an illustration of the advantages to be derived from intercourse with our fellow business men let me draw your attention to the Society of American Florists. The founders of this society had in their mind when they broached this subject the mutual benefit it might be to an immense number of their fellow men all over the country; but I venture to assert that not even the most sanguine of them then thought that there would in the space of six short years be such a vast benefit derived from it all over the country. Skeptics to-day claim it's no good to them (such as are afraid to let their neighbors know what they are growing) but they are in the very small minority. The greater bulk of our struggling brethren frankly acknowledge that they have been greatly benefited by the able articles and discussions which are given at its convertions every year. Furthermore a great improvement in the matter of cultivation, in making up and arranging of flowers much of which can be traced directly to the influence of what has been done by the S. A. F. and the information diffused by it can be seen by the observant in every town in the country, and, while it may slightly reduce the demand for certain lines of goods to some individual firms, it has widened the demand immensely in others and created a much wider field which is benefiting the whole trade of the country.

"Cannot we do for this city and those of our trade doing business in this city something to be of mutual benefit to all engaged in the florist business? Yes, by harmony on the word home!"

Rose Petals.

Among the "society people" that entertain extensively there is a constant demand for something new and novel; this is especially so in the way of table decoration for dinners. A decoration that we have used for the past two years, and has never failed to give pleasure, is one in which we have used the petals of roses. It is necessary to use judgment in recommending it to certain people, as the thought of destroying beautiful roses for any purpose would not be agreeable. But as flowers arranged in any form, unless the stems are in water, are of little value after an entertainment, the petals fulfil the mission of the flower in one way quite as well as another, if the effect on the guests is pleasing.

In taking an order of this kind it will save time and unnecessary annoyance if you request that nothing but the cloth be put on the table. We generally find that the caterers have the table pretty well covered, and their ideas and ours do not always agree, but in the petal decoration it is better that nothing be on the table while you are working.

We place narrow strips of wood around the table, thirteen or fourteen inches from the edge. If a center piece is to be used, which is generally advisable, place that and what candelabra or other large ornaments that are desirable; if a rose bowl is used we put the same kind of roses in it that the petals are from. The corners of the table are often round, if so we carry out the shape with our decoration, always leaving thirteen or fourteen inches for plates, wines, etc.

We have used La France petals on the table, vases thirty inches tall filled with Mrs. Alpheus Hardy chrysanthemums on each end, above the line of vision, and a

rose bowl filled with La France roses below the line of vision in the center, clusters of the same flowers placed at each lady's plate.

After finishing we carefully sprinkle the whole decoration. The effect is charming, drops of water on the chrysanthemums and roses give them a particularly fresh appearance and the little globules of water quiver and dance in the cup-shaped petals throughout the whole dinner, reflecting light and color in the prettiest manner possible.

On entering the room the effect is as though a plush scarf extended the entire length of the table. We have made monograms and placed them at each end; these we make as delicately as possible on wire frames, tying flowers on without moss, but not allowing them to come much above the petals, as though the monogram was worked in the scarf.

One of our first attempts in this line we tried the experiment of using different colored petals, placing them in diagonal lines in the center, Jacques, La France on each side, then Perles and finally Brides on the ends, blending the edges of the line together as much as possible. The effect produced was rather novel, but not as pleasing as one color. Often you can trace pretty figures and curved lines with some colored petals that contrast well. We have also used yellow chrysanthemum petals and purple violets with good effect.

We have an imported guest card which is a splendid imitation of a natural petal: the guests' names are written on these cards and placed at each plate, and finally we float rose petals in the finger bowls. If any florist is interested in this decoration and is unable to get the rose petal guest cards, I will take pleasure in making an effort to get them or send the name of a dealer who has them. They have been on the market several years, but when we wanted them we found but one dealer in the city that had them in stock.

H. H. BATTLES.

Florist Versus Caterer.

A number of years ago, when I launched my bark on the troubled seas of the retail florist, a table decoration generally consisted of a plateau of flowers for the center, and if it were to be rather an elaborate decoration, an oval plateau for the center and a round one at each end, with smilax around the table, was about the thing. These were delivered at the door, received and put on the table by the caterer. I remember one case when the florist was bold enough to attempt to put the plateaus on the table; he was sharply reprimanded by the caterer and cautioned about breaking glasses, when reaching over them. Another time when a florist delivered a plateau, he was met at the door by the caterer and when he said he had no smilax the caterer said, "you're a pretty florist, you are, not to bring no smilax for around de plates." And today many caterers when taking an order to serve a dinner include flowers in their bid; what are the consequences? In many cases the caterer gets the lion's share of the profits and if the flowers do not please it reflects discredit on our business and possibly the people will argue that the flowers gave so little pleasure that next time they will do without them.

In dealing with caterers we have taken a decided stand. We do not allow a percentage to any of them; if they buy flowers from us they state the amount of money they wish to spend; if they want a receipted bill they get it for that amount. We have known of florists giving a receipted bill for the full price with a cash discount, which did not figure in the bill. This we deem very unadvisable, because if the flowers do not please the caterer has the bill to show the customer, which reflects discredit upon the florist.

Oftentimes the caterer, if he is unsuccessful in getting the order for the flowers, will make it as unpleasant as it is possible for the florist; this he can do in many ways.

Generally when we go to a house to decorate a table, unless we have made special arrangements, the caterer has the table crowded with glassware, fruit, relishes, candelabra, etc. Most of these we ask him to remove, then he commences to talk, but finally removes them. The next time we meet the caterer at another house he don't talk so much, nor does he like us any better, but he knows that we are there for business.

After arranging our flowers we put on the candelabra and what ornaments we think advisable and either put on or recommend what relishes, salted almonds and bonbons will add to the effect. We see that the water is in the finger bowls, and either put some scented foliage such as lemon trifolia or rose geranium leaves, but generally several small flowers such as violets, sweet peas, pansies or some thing of the kind.

Before leaving we always make a point of seeing the lady of the house, often placing the guests' cards as she reads the names from the list, and finally suggest that the waiters pass many things that we have deemed advisable to leave off the table, such as fruit, colored cakes, etc., the color of which often mars the harmony of the decoration.

If we are successful in pleasing that lady we have established in one person's mind that the florist is the one to superintend the decorating of a table, and have taught one caterer to stand aside while we are doing our work and that his place is to provide, cook and serve the refreshments.

If all the florists would take this stand it would help the whole business wonderfully and I believe more and better work in this line would be done. Can we not hear from other florists on this subject?

A RETAILER.

CEROXYLON ANDICOLA.

Palms.

The engravings represent two of the most beautiful, expressive, and distinct forms to be found in this, the grandest of all exotic vegetation.

Ceroxylon andicola, or niveum, is a native of New Grenada. It is of a silvery grey tint on the upper surfaces, and is effective beyond question. The greatest beauty of the plant, however, is when it arrives at a size where the under side of the fronds are displayed. The under sides of the fronds then show as if they were made of solid silver. Mr. G. Bennett, of Flatbush, exhibited the plant from which the engraving was made. It was seven feet high and had six perfectly formed fronds.

Pritchardia grandis is entirely different and distinct from the ceroxylon. It is a palm such as artists in bronze repousse, and expressive designs will always desire. This is known also as Licuala grandis. It matters not whether it is pritchardia or licuala, the plant is always a great beauty. It comes from New Britain. It is no use giving a description of this beautiful plant, as our engraving shows how it is represented in a 10-inch pot. It was about four feet high and as much in diameter. It was shown by Messrs. Siebrecht & Wadley, and did them great credit, showing fine cultivation.

JOHN THORPE.

PRITCHARDIA GRANDIS.

Gesneras.

This genus contains many beautiful species, and the plants when well grown are very useful for greenhouse decoration. They are remarkable for their handsome foliage, which is as soft as velvet and beautifully variegated. The long, upright spikes of brilliant colored flowers are mostly scarlet or yellow, although some of the varieties have spotted flowers.

The gesneras are tuberous rooted plants, and by judicious treatment can be had in bloom at any time of the year, but they do best in summer. As is the way with many other tuberous rooted plants, they are often neglected after they are done flowering, so that they dwindle away instead of increasing in vigor, and when the time comes to repot and start them into growth again, the tubers are found to be decayed and worthless. After they are done flowering keep them growing until the foliage begins to decay, then give them less water, and as soon as growth is completed withhold water altogether. After this store away in a dry place until again required, but do not let them become so dry as to get the soil baked, or they are apt to be injured by dry rot. In fact, give them the same treatment as you would caladiums at rest, and they will come out all right. It is always best to start into growth in the old soil, and as soon as started shake out and repot in small pots, and as soon as they are full of roots shift into larger pots, using a mixture of good loam, a little peat and well decayed manure. They like plenty of water at the roots, but care must be taken to keep the foliage dry, therefore they must not be syringed at all.

They are propagated by division of the tubers or by cuttings, which root readily. When cuttings are used it is a good plan to take them early in the season in order to give sufficient time to make a tuber, for if no tubers are formed the plant dies when it goes to rest. They are easily raised from seed and oftentimes the seedlings surpass the parent in beauty, and in a batch of seedlings you may have no two plants alike. The seed should be sown early in spring. Put the seed pans in a warm, moist place; as soon as the seedlings show the second leaf prick out into shallow boxes or pans, and when large enough to pot shift them into small pots and treat them the same as you would old plants. The second summer most of them will flower.

G. Zebrina is a very handsome and distinct variety, with dark, marbled foliage, and producing a large panicle of orange scarlet flowers.

G. nægelioides lilacinella is a fine plant, with large cordate leaves of deep green, above paler and lanate below. The flowers are large and of a delicate lilac, the throat lemon color.

G. Suttoni alba: This is an entirely distinct species from Brazil, having pure white flowers.

G. chromatella: A garden hybrid with rich dark foliage and erect spikes of drooping flowers of a rich yellow color.

G. Exoniensis: A very free flowering variety, with rich, dark foliage, the leaves being covered with minute red hairs and changing color according to the light, giving the plant a remarkable appearance.

There is an endless number of garden hybrids of this species. They are all very handsome and are largely used for decorative purposes in Europe. If grown more extensively here they would become popular, as their rich appearance arrests the eye at once. JAS. S. TAPLIN.

Maywood, N. J.

Leaves of Advice From a Limb of the Law.

(For Young Florists.)

XXXII.

WHEN TITLE PASSES.

I've often talked to you about the title to property and when it passes. The question you ask me now brings up the subject in a new form. It seems, if I understand you correctly, that a small dealer in seeds and plants came into your store and laid down on your counter a bag of dahlia bulbs, and said you might have them for $10. You replied: "Very well, I'll take them." He had an errand somewhere else, and said he would return for his money. Meantime you examined the bulbs, and made up your mind that they were not worth the money, and refused to pay. He, on his part, refused to take them back, saying that it was a sale.

Let me say right here that it was a careless way to do business, anyway; but I don't think any title passed to you, for you never removed the bag from the counter; you performed no act of ownership over the bulbs. You didn't know really that they were bulbs.

Let us suppose it had been a lot of plants in pots which were plainly visible on your counter, then the title would have passed the moment you had accepted his offer. The law requires that there shall be not only a meeting of the minds of buyer and seller, but that the property shall be fixed and certain.

If I say, "I'll give you $50 for all the Bon Silene roses in your hot houses," and you accept my offer, no title passes until some act takes place to render the transaction more definite. You may not have any such roses or you may not be able to deliver them. Delivery need not be actual to be binding, but there must be a possibility of delivery. For instance, I want to buy a hundred fancy shade trees for my lawn, and you say you'll charge me $100. I accept, but no title passes up to that point.

Suppose, however, we walk out to the nursery, and I pick out the trees I want, still no title passes to me until I have made payment or part payment, for the amount being $50 and over calls for some memorandum in writing or part performance.

If you sell me a bill of goods "on approval," no title passes until I accept; but failure to return within a reasonable time would be acceptance, unless it had been agreed that I was to give written or verbal notice of acceptance.

You ask me: "Suppose a man buys so many fruit trees of me and pays one-half or one-third cash, and the trees are burned while still in my storehouse, upon whom would the loss fall?" Upon you, unless you had made an effort to deliver and he had requested you to hold them a little longer. Then the relations become changed and you are acting as his agent.

No title passes at a sale if the goods are not yet in a condition to be delivered, by which I mean that their destruction by fire or otherwise falls upon the seller.

Now as to the necessary "mem" to pass a title when the goods are of the value of $50. The form is quite immaterial. It may be in pencil, may be signed by the initials of the parties. But there must be a distinct and certain reference to the goods so that on the face of the "mem" a man of ordinary intelligence could get at the gist of the sale. This "mem" must be positive in its statement. Any such phrase as "provided" or "upon certain conditions" would invalidate it.

In some states it has been held that an oral contract which would be void on account of there being no "mem" of it in writing, would be upheld provided the person to be charged had admitted in a letter to a third person that he had made such a contract.

In the absence of fraud, which you must always bear in mind invalidates all contracts, the moment you deliver the article and hold the money in your hand the title has passed, even if you have not yet made change.

A minor, however, may disavow a contract of sale and return the articles, but not so if he be acting as the agent of his father.

No doubt you have many married women coming here to order flowers. It behooves you to ascertain whether it is done with the knowledge and consent of their husbands, for flowers are certainly not what the law calls "necessaries," for which a husband would be liable in any event.

Whenever goods are ordered without being seen there can be no passing of title even if cash is paid down, for the buyer cannot know whether the goods will come up to the promise made him, or be equal in value to the sample. In such a case no title will pass until the goods have been delivered and accepted.

In your business, on account of the perishable nature of your goods, there should be an immediate return of the goods or notice of refusal to accept them.

It is always advisable for you to inform your customers, when upon an absolute sale to them they make a request that you hold the goods for them, that you do so at their risk. Nor do I think that a mere placard hung on the wall would be sufficient notice. You should bring it to their notice in positive and absolute terms. Printed conditions on the billhead would be good enough notice.

Ah, yes. I'm glad you spoke of exchanges, for they often occur in business life. The rule, then, would be that there should be an absolute delivery on both sides. So long as this did not take place the exchange would be incomplete, unless you had seen the property offered in exchange, and were perfectly acquainted with its advantages and defects. Even then I think you would have the right to return it upon specifying that it had been allowed to deteriorate since you had last seen it. You ask me whether you in your counter transactions are required by law to "make change." I say, strictly speaking, no! If a customer enters your store and says: "I'll give you the price asked for those chrysanthemums provided you'll throw in the azaleas standing there," you accept the offer, and he tenders you a bill of large denomination in payment, no title passes. You would not be obliged to make change for him, and he could not insist that the title had passed to him.

Making change is often a real hardship and a thoughtless dude will offer a "fiver" in payment for a five cent pink for his buttonhole, and look deeply grieved because you will not empty your cash drawer to please him.

UNCLE BLACKSTONE.

Wreath.

The wreath as shown in the illustration was made entirely of white carnations. In this case we put a cluster of valley, which was apparently fastened on with a band of light purple pansies (not blue). In summer time, when flowers are scarce, we make many of our designs in this style, using balsams, making the design as symmetrical as possible, and trusting to the flowers that we put on top to relieve the stiffness. The effect to us is very pleasing, and gives an excellent opportunity for making pretty combinations of color. For instance, let the design be a wreath or a cross, after making it as above, take a cluster of Perle roses, and lash them on with a band of *light blue* (not purple) myosotis (forget me not), or a cluster of pink roses with band of mignonette is also a beautiful combination. A veil of Adiantum Farleyense on the pure white design is beautiful, and when a touch of pink is added is still more lovely. An anchor made entirely of white with a rope of colored flowers is good.

H. H. BATTLES.

New Roses.

At Messrs. E. G. Hill & Co.'s establishment at Richmond, Ind., roses are the leading feature and judging from the immense stock of Waban which Mr. Hill has worked up he must certainly have great faith in this new rose. The finest plants of this variety I have seen anywhere were at this place. His stock plants are 20 inches high and full of vigor.

Probably Mr. Hill is the largest grower of new roses in this country. He has them from France, Germany, England, Ireland, etc., and from the vast number of varieties he has on trial, we certainly should expect some few valuable additions to our already fine list of forcing varieties.

Last year's novelties of promise are Mme. Zea Cologne (H. T.), a rose of the La France type, but darker than it or Albany; Mme. Gustave Piganeau (H. P.) fine in form, good finish, and of a beautiful ruby crimson, shaded scarlet; this is probably the best H. P. rose of recent introduction; Mr. H. thinks this will rank with any of the ten best now in cultivation. Another good H. P. is Gloire des Brussels, about the same color as Princess Camille de Rohan, but a much finer and better shaped flower and a more vigorous grower. Mr. H. thinks well of the Dickson's new hybrid roses, Earl Dufferin, Lady Arthur Hill, James Brownlow and Margaret Dickson.

Among the tea roses of last year that are promising are J. B. Varrone, in the way of Luciole, but superior to this variety, being a freer bloomer and of better constitution; Martha du Bourg is a very pleasing rose, flesh white with crimson shading; Mme. Pierre Guillot will surely come to the front as a forcing rose, being superior to Mme. Watteville in every way both in color and freedom of bloom.

Among the novelties of this year are some very promising ones, notably: Mme. A. Veysset (H. T.), a beautiful striped sport from La France, very pretty and attractive. Triumph de Pernet Pere (H. T.), is a valuable addition to the H. T. family on account of its fine, bold flowers and the freedom with which it produces them.

Mr. Hill has an interesting seedling which he purchased of J. B. Guillott while in Europe two years ago. I was fortunate enough to see a few good blooms of this very striking variety, resembling Clotilde Soupert in freedom of bloom and growth. In color it is quite unique and entirely distinct from any other variety, being a deep copper red with bright yellow shadings, varying from this to a flesh pink with intermediate shadings. This will certainly be a first class variety for the catalogue men.

Kokomo, Ind. W. W. COLES.

Toronto.

The convention is booming here just now. The daily papers are talking about it, citizens are curious, the pulse and temperature of all in the trade has gone away up above normal, the city aldermen want to take a hand in the entertainment business in order that things may be done in proper style and that Toronto may not lose the good name she already possesses in the minds of neighbors across the line—an imaginary line after all if it was not for those meddlesome customs officers.

Alderman Hallam, who entertains the convention and ladies, the local club, their wives and sweethearts, and the city council, at a garden party on Wednesday afternoon, has taken hold of his part with a will that is sure to make that afternoon a most enjoyable one. Alderman Hallam's residence—"Chorley Park"—is situated in a new suburb of Toronto where there are some delightful little bits of scenery, and is really quite a romantic spot.

The bowling contest will be under the management of Mr. John N. May, so that there need be no fear but what that affair will be carried out satisfactorily to all parties concerned, except to those who don't win the cup and those who don't do that will have only themselves to "cuss."

The ladies (God bless 'em) will receive particular attention from the entertainment committee on Tuesday afternoon, Mr. Laing, the chairman of that committee, having done his utmost that they shall have every attention paid them and have as enjoyable a time with as little fatigue as possible. The ladies committee will also see after their comfort and welfare.

On Friday, the day of all days, the day I will say nothing about at present, as I wish it to gradually dawn on the minds of the members of the society that the Toronto "boys" are *the* "boys" and that Canada is not a bad sort of a place after all. The Toronto G. and F. Club wants to see every member of the S. A. F. who can possibly leave home, at this convention. E.

Boston.

David Allan's youngest little girl died on Tuesday, August 2, aged 20 months.

Benj. Durfee, of Strauss & Co., Washington, was in the city a few hours on duty with the senate tariff committee.

A son of J. Geist, florist of Melrose, was nearly electrocuted recently while fooling with a live electric wire.

D. Zirngiebel is disturbed by the discovery of a new worm on his pansies. It is about an inch in length, bright green in color, and eats the leaves and flowers as though it enjoyed them. He tried paris green on them with good results.

At the August meeting of the G. and F. Club a letter was received from the Massachusetts Horticultural Society thanking the club for special premiums offered for mantel decorations and chrysanthemums at the coming fall exhibitions. Resolu-

WREATH.

tions of condolence were adopted in regard to the recent deaths in the families of Robert Farquhar and David Allan. The usual nominating committee was appointed to bring in a list of officers for the ensuing year to be voted for at the September meeting. A letter was received from D. B. Long, of Buffalo, inviting the club to be represented at a delegate meeting of florist's clubs which is to be held at Toronto during the S. A. F. convention. President Foster, Lawrence Cotter, W. H. Elliott, Jackson Dawson and P. Welch were elected and instructed accordingly.

The Saturday exhibition at Horticultural Hall on August 8 was as usual largely attended. The specialties for which premiums were offered were native flowers and perennial phloxes. The prizes for native flowers were awarded to Mrs. P. D. Richards, E. H. Hitchings and I. E. Coburn respectively. In phloxes A. H. Fewkes was first, James Comley, second, and J. H. White, third.

L. W. Goodell showed some beautiful Dianthus Heddewigii, Poppies and Phlox Drummondii. Also a pretty aquatic, Limnanthemum indicum. C. M. Atkinson had a nicely bloomed plant of Odontoglossum Harryanum and an assortment of cut flowers.

The cut flower market is full to overflowing with sweet peas and splendid asters. Gladioluses are beginning to come in freely. The overstock of roses is somewhat reduced and trade is more encouraging. Pink pond lilies continue to sell well. W. J. S.

Philadelphia.

Asters are now coming in and form a welcome addition to the stock of summer flowers. The cool weather seems to have just suited them, as they are very fine, the flowers being large and double and the colors bright.

Lilies of the valley are plenty and can be had in quantity for $4 to $5 a hundred. It seems to be quite as easy to flower now as in winter and the sprays are equally as good. Cape flowers are now being handled in large quantities by the city florists. They are being stemmed and laid away for future use or made up into designs to replete the stock.

Mr. John Westcott, chairman of the transportation committee to Toronto, is resting and fishing at Barnegat Bay, preparatory to the trip. With Mr. Westcott in charge a good time is doubly assured, and it is quite certain that the journey from Philadelphia to Toronto will long be remembered by those participating.

The last meeting of the Florist's Club was largely attended. All were interested in Mr. Westcott's paper, "How to go to Toronto."

The delegation from Philadelphia and vicinity will number from forty to fifty, perhaps more, as many do not make up their minds until the last day. At the meeting of the club quite a number were on the fence, but may be found grip in

hand at the station on the morning of the 17th.

The bowling contest attracts no little interest and some large scores are certainly looked for. Local matches are at times very exciting but when compared to an international contest such as this is to be they only serve as preparatory steps. May the best team win and may they be found to have hailed from the Quaker City. Y.

Directory of Clubs and Societies.

The Florists' Club of Philadelphia:
Robert Craig, Pres , 49th and Market Sts.
H. F. Michell, Sec'y, 714 Chestnut St.
Meets first Tuesday of each month at Horticultural Hall, Broad street above Spruce. Organized October 5, 1885. Annual election of officers first Tuesday in October.

The Chicago Florist Club:
G. L. Grant, Pres., 54 La Salle St.
F. F. Benthey, Sec'y, 175 Wabash Ave.
Meets second and fourth Thursdays of each month at 54 La Salle street. Organized Nov. 3, 1886. Annual election of officers the fourth Thursday in October.

The Gardeners' and Florists' Club of Boston:
L. H. Foster, Pres., 13 Mather St , Dorchester, Mass.
J. J. Cunningham, Sec'y, Readville, Mass.
Meets at Horticultural Hall, Boston, first Tuesday of each month. Organized January 7, 1887. Annual election of officers first Tuesday in September.

New York Florists' Club:
A. S. Burns, Pres., 11 West 28th St.
John Young, Sec'y, 53 West 30th St.
Meets second Monday of each month at Germania Hall, 194 Third Ave. Organized July 6, 1887. Incorporated February, 1891.

Montreal Florists' and Gardeners' Club:
James McKenna, Pres., Cote des Nieges.
W. Wilshire, Sec'y, 688 Sherbrooke St.
Meets second and fourth Tuesdays of each month, at Cathcart Hall, Natural History Society Building. Organized November, 1888. Annual meeting fourth Tuesday in March.

Toronto Gardeners' and Florists' Club:
John Chambers, Pres., St. Lawrence Hall, Toronto, Ont.
A. H. Ewing, Sec'y, Normal School, Toronto, Ont.
Meets second Wednesday of each month in Room 2 Y. M. C. A. building, corner Gerrard and Yonge Sts. Organized October, 1889. Annual election of officers second Wednesday in November.

Buffalo Florists' Club:
Wm. Scott, Pres., 479 Main St.
Dan'l B Long, Sec'y, 457 Main St.
Meets second and fourth Tuesdays of each month at 557 Main St. Organized December 7, 1888. Annual election of officers second Tuesday in March.

Gardeners' Club of Baltimore:
Wm. Fraser, Pres., 1744 N. Gay St.
Henry Bauer, Sec'y, 1875 N. Gay St.
Meets second and fourth Tuesdays of each month at Knapp's Hall, 205 N. Halliday St. Organized March 17, 1887. Annual election of officers fourth Tuesday in March.

St. Louis Florists' Club:
Chas Connon, Pres , 2742 Olive St.
S. Kehrmann, Jr , Sec'y, 21 S. Broadway.
Meets first Tuesday in each month, at Odd Fellows Building, 9th and Olive Sts. Organized August, 1887. Annual election of officers first Tuesday in August

Society of Indiana Florists:
Fred Dorner, Pres., Lafayette.
Wm. G. Bertermann, Sec'y, Indianapolis.
Annual convention at Indianapolis, in November, during chrysanthemum show. Organized 1886.

Indianapolis Florists' Club:
J. J. B Hatfield, Pres , U. S. Arsenal.
Wm. G. Bertermann Sec'y, 37 Mass. Ave.
Meets first Thursday of each month at 37 Mass. Ave. Organized 1887. Annual election of officers at the December meeting.

The Cincinnati Florists' Society:
Geo. Corbett, Pres , College Hill, O.
E. G. Gillett, Sec'y, 136 Walnut St., Cincinnati, O.
Meets on the second Saturday of each month genetally at the Burnett House. Organized January 11, 1889. Annual election of officers at the January meeting.

Gardeners' and Florists' Club of New Bedford, Mass:
Josiah Eaton Jr., Pres., 99 Cottage St.
Geo. C. Bliss, Sec'y, 34 Arnold St.
Meets second Wednesday of each month. Organized January 17, 1887. Annual election of officers second Wednesday in August.

Society of Minnesota Florists:
E. Nagel, Pres , 1118 West Lake St. Minneapolis.
Gust Malmquist, Sec'y, Fair Oaks, Minneapolis.
Meets twice a year, the annual meeting the second Thursday in September, at which officers are elected. Meetings held alternately in St. Paul and Minneapolis. Organized February 25, 1888.

Minneapolis Florists Club:
Wm. Desmond, Pres , Cor. Portland Ave. and 24th St.
E. Nagel, Sec'y, 1118 West Lake St.
Meets second Saturday of each month at the West Hotel, corner Hennepin Ave. and Fifth St. Organized October 14, 1889. Annual election of officers second Monday in November.

Pittsburg and Allegheny Florists' and Gardeners' Club:
E. C. Reineman, Pres., 39 Fifth Ave. Pittsburg.
G Oesterle, Sec'y, 5 8 Smithfield St., Pittsburg.
Meets second and fourth Tuesdays of each month at Maginn's Hall, Federal St., Allegheny City. Organized January, 1891. Annual election of officers the fourth Tuesday in January.

Florists' Club of Washington, D. C.:
Robert Bowdler, Pres., Centre Market.
Eugene Cadmus Sec'y, 1419 R St., N. W.
Meets first Tuesday of each month at U. S. Botanical Garden. Organized March 7, 1889 Annual election of officers first Tuesday in March.

Forest City Florists' and Gardeners' Society:
George W. Rennie, Pres., London, Ont.
Wm. Gammage, Sec'y, box 155, London, Ont.
Meets first Monday in each month at Western Fair rooms Richmond St , London, Ont. Organized 1887. Annual election of officers at December meeting.

Society of Northwestern Pennsylvania Florists:
P. S Ingham, Pres., Oil City, Pa.
H. B. Beatty, Sec'y, Oil City, Pa.
Meets first Thursday of each month. Organized August 20, 1890. Annual election of officers at the August meeting.

Gardeners' and Florists' Club of Hamilton, Ont.:
F. G. Foster, Pres.
H. Browne, Sec'y, Wentworth St.
Meets first and third Tuesdays of each month from October to March inclusive, and first Tuesday of each month from April to September. Annual election of officers the third Tuesday in October. Meetings held at the Hamilton Association Rooms, Public Library Building. Organized October 27, 1890.

Wisconsin Florists' and Gardeners' Club:
A. Middlemass, Pres., Forest Home Ave , Milwaukee.
C. B. Whitnall Sec'y, 438 Milwaukee St., Milwaukee.

Little Rock (Ark) Florists' Club:
Joseph W. Vestal, Pres.
D. M. Tipton, Sec'y.

Florists' Club of California:
Emory E. Smith, Pres , 321 Market St , San Francisco.
M. H. Wilkins, Sec'y, San Francisco.
Organized in March, 1891.

MISCELLANEOUS ORGANIZATIONS.

Baltimore Cactus Society:
Fred W. Lantz, Sec'y 112 N. Poppleton St., Baltimore, Md.

American Wild Flower Club:
Chas. S. Horn, Sec'y, Wilmington. Del.

Erie Chrysanthemum Club:
H. Tong, Sec'y, Erie, Pa.

New Haven Chrysanthemum Club:
Miss Francis S. Ives, Sec'y, 478 Orange St., New Haven, Conn.

California State Floral Society:
Emory E. Smith, Sec'y, 321 Market St , San Francisco.

News Notes.

HORNELLSVILLE, N. Y.—W. A. Wettlin has added a new house 20x85.

AVOCA, IOWA.—Mr. D. M. Briggs, the florist, died July 9, aged 69 years.

CLEVELAND.—An Agave Americana is now in bloom at the conservatories of Mr. Isaac Leisy.

MILWAUKEE, WIS.—F. P. Dilger is building two new houses, one 100x14 for roses and a smaller one for violets.

IRONTON, O.—E. Miller is putting in a steam boiler and will in the future heat about 8,000 feet of glass by steam.

LENOX, MASS.—The Gale Floral Co., of Springfield, has opened a store here for the season—July to October inclusive.

PHOENIXVILLE, PA.—Sales of bedding plants this spring were about 15 per cent less than last year. Prices were very low here. Money scarce.

GREENSBORO, N. C.—The ninth annual exhibition of the North Carolina Horticultural Society was held here August 4 and 5. It was very successful.

UNDER THE recent reciprocity treaty with San Domingo, trees, plants, vines and seeds will be admitted free of duty from the U. S. to that country.

GRAND RAPIDS, MICH.—Crabb & Hunter have added two new rose houses to their plant, each 40x20, and will begin at once to erect a carnation house 80x26. The heat is steam and the fuel this winter will be crude oil, the coming florists' fuel.

WASHINGTON.—At the meeting of the Florists' Club on the 4th inst., after discussing the flower market project, delegates were appointed to attend the Toronto convention and they were instructed to invite the S. A. F. to hold the convention of 1892 in this city.

EVANSVILLE, IND.—Spring trade was about 20% better than last season. Four-inch geraniums retailed at $1.50 a dozen. More demand for roses in pots. Good plants in 4-inch pots sold at 25 to 30 cents each, 5-inch at 35 to 40 cents each, 6 and 7-inch at 50 to 75 cents each. Geraniums sold slow.

NEWPORT, R. I.—At the meeting of the Newport Horticultural Society, June 24, a very instructive paper on orchids was read by Mr. Richard Gardner, gardener to Cornelius Vanderbilt, Esq. Mr. John Butler, Berkeley avenue, is now recording secretary of the Hort. Society, Mr. James Galvin having left town.

BRAMPTON, ONT.—H. Dale has added upwards of 30,000 feet of glass this summer, giving him a total of 50,000 feet. The houses are heated by steam, and glazed with 16x16 glass, butted. Of the new houses one is 21x200, one 11x200, one 25x90 and two 21x350. They will be used for growing cut flowers.

NEWARK, N. J.—Mr. Henry Bird, the florist, was married to Miss Carrie Scudder, also of this city, at Niagara Falls, July 29. The ceremony was performed at the center of the suspension bridge, amid the falling spray and the thunder of the cataract. Mr. Bird recently sold out his florist business to Smith & Scudder; the latter is a brother of the bride.

PADUCAH, KY.—C. L. Brunson & Co. have erected a new greenhouse 100x20 on their grounds at Rowland Place. It is three-quarter span, with all modern improvements. All the material was purchased from advertisers in the FLORIST and the builders express much satisfaction with the manner in which their orders were filled.

PITTSBURG.—Work on the details of the coming exhibition is progressing most satisfactorily. Leading citizens have signified their intention of offering handsome special premiums, and when these are added to the regular list we shall have a very liberal schedule. The daily press has taken the subject up and considerable interest in the affair is already shown.

MILWAUKEE.—At the meeting of the Wisconsin Florists' and Gardeners' Club, August 5, the following officers were

PAVILION IN THE HORTICULTURAL GARDENS, TORONTO, ONTARIO, IN WHICH THE COMING MEETING OF THE SOCIETY OF AMERICAN FLORISTS WILL BE HELD.

elected for the ensuing term: A. Middlemass, Pres.; Wm. Edlefsen, Vice-Pres.; C. B. Whitnall, Sec'y; H. Haessler, Treas.; Messrs. O. Schucht, of Sheboygan, and F. P. Dilger and C. B. Whitnall, of this city, were appointed delegates to represent the club at the convention of clubs at Toronto.

LITTLE ROCK, ARK.—At the last meeting of the Little Rock Florists' Club there were thirteen members present. The following officers were elected for the ensuing year: Jos. W. Vestal, Pres.; M. W. Herron, Vice-Pres.; D. M. Tipton, Sec'y.; Chas. Vestal, Treas. After a short discussion we adjourned to meet in one week to devise plans for holding a chrysanthemum show some time in November.

MASCOUTAH, ILL.—A stranger representing himself to be the traveling agent of the Williamson Nursery Company, of Centralia, Ill., succeeded in getting John Renth and Ben Schoene, two prominent farmers living north of here, to sign a paper recently, purporting to be an order for fruit trees. The papers have turned up in the shape of notes for $85 and $90, respectively, and were purchased in good faith by Gust J. Schere, the real estate agent. The swindler made good his escape.

LOS ANGELES, CAL.—The Southern California Horticultural Society will hold its second annual exhibition in this city October 27 to 31. A schedule of prizes has been printed and may be had on application to the secretary, Mr. H. W. Kruckeberg, this city. Prizes are offered for chrysanthemums, roses, greenhouse plants, miscellaneous plants, evergreen trees, citrus trees, cut flowers, fruits, nuts and vegetables. There is also a list of prizes for amateurs, in plants and cut flowers only.

SPRINGFIELD, MASS.—Everything points to the success of the exhibit of the Amateur Horticultural Society, which it is now thought will be held on Tuesday and Wednesday, September 1 and 2. The society is in a highly prosperous condition, both financially and in numbers, the treasury showing over $800 balance, while the enrollment of over 200 members since January 1 brings the total membership up to 750 and makes it the largest amateur society in the country and the second largest of any horticultural society in the United States.

CINCINNATI.—The 34th monthly meeting of the Cincinnati Florist Society was called to order by Pres't Corbett, at the office of J. M. McCullough's Sons. The attendance was very good and and the meeting a very interesting one. Several new names were handed to the secretary to be added to the membership list of the society. The society will not hold a chrysanthemum show this fall. The flower market now seems to be a certainty, and a vote of thanks was tendered the administrators of the Holroyd estate for services rendered; also to the Market Protective association. A committee of three was appointed to represent this society at the called meeting of the Florists' and Gardeners' Clubs at Toronto. Business is dull and stock at present very poor, but prospects for fall are excellent. There will be only four or five of our florists who will attend the Toronto convention.

Chicago.

Market very quiet last week. Prices have weakened somewhat. Roses are offered at 2 cents on the average, although job lots are disposed of at much lower figures.

Flowers of all kinds and roses in particular have suffered severely from the blistering heat of the last few days, and it will take some weeks before the stock will be in condition again.

Garden flowers meet with very little demand. The quality has been poor owing to the protracted drought, but it is hoped that Sunday's rain will improve the crop.

On of the daily papers now announces that the Chief of the Bureau of Horticulture will be appointed Friday of this week.

The "Palace Floral Co." is the imposing name which has recently appeared on the window of the very modest frame building at 215½ North Clark street.

Off for Toronto next Monday afternoon.

Among recent visitors to the city were Harry Sunderbruch, Cincinnati; C. Kranz, Muscatine, Ia.; P. W. Armstrong, Arcola, Ill.; Chas. Woodill, of Thorburn & Co., New York; H. W. Buckbee, Rockford, Ill.; E. D. Sturtevant, Bordentown, N. J.; G. J. Braun and G. H. Smith, Denver.

THE BROOKLYN, N. Y., *Standard* laments that that city has no horticultural society, and alleges that the city is behind the times in horticultural matters. Can not some of the florists of Brooklyn assist the *Standard* in an agitation of the matter which shall result in the organization of a society?

THE AMERICAN FLORIST

Subscription $1.00 a Year. To Europe, $2.00.

Advertisements, 10 Cents a Line, Agate; Inch, $1.40; Column, $14.00. Cash with Order.

November 11-13, St. Louis.—Chrysanthemum show St. Louis Florists' Club. S. Kehrmann Jr., Sec'y, 21 South Broadway.

November 11–13, Springfield, Mass.—Chrysanthemum show Hampden County Hort. Society. George D. Pratt, Sec'y, 192 Maple St.

November 11–13, Utica, N. Y.—Fall exhibition Utica Florists' Club. J. C. Spencer, Sec'y.

November 12-14, Buffalo.—Chrysanthemum show Buffalo Florists' Club. Dan'l B. Long, Sec'y, 457 Main St.

November ——, New Orleans, La.—Chrysanthemum show New Orleans Horticultural Society. Chas. Wise, Sec'y, Third and Prytania Sts.

November ———, Germantown, Pa.—Chrysanthemum show Germantown Hort. Society. Thos. E. Meehan, Sec'y.

November ————, New Haven, Conn.—Chrysanthemum show New Haven Chrysanthemum Club. Miss Frances S. Ives, Sec'y, 478 Orange street.

November ———, Syracuse, N. Y.—Chrysanthemum show Central New York Hort. Society. H. Youell, Sec'y, 228 Beecher street.

November ————, San Francisco.—Chrysanthemum show California State Floral Society. Emory E. Smith, Sec'y, 321 Market St.

TREES, plants, shrubs and garden seeds will now be admitted free from the United States to Cuba and Porto Rico, as one of the results of the recent treaty with these countries.

WE have received another lot of tuberous begonia flowers from Messrs. F. J. Meech & Son, Charlevoix, Mich. They arrived in sufficiently good condition to show that they were certainly grand flowers when shipped, but hardly in shape to describe by name, and many of them were labelled. The flowers held together admirably, especially the double ones, but were sadly bruised. To arrive in good condition these flowers should be packed in much the same way as camellias, as they seem to be equally as subject to injury from bruises. As these begonias become better known we believe they will be largely grown for summer flowers, though whether they are available for bedding remains still to be demonstrated. But what a grand decorative subject a well grown plant in a 5-inch pot makes! Nothing could be more effective for conservatory decoration in summer, and wouldn't they sell well as pot plants for the window? Mr. Meech includes in the lot sent quite a number of blooms cut from plants grown from seed. While these do not equal the named sorts they are still of large size and splendidly colored.

WE LEARN that M. Kelley, Duluth, Minn., is the wife of E. Kelley, same place, and that orders signed by either name are substantially from the same party. We also have reliable information to the effect that the C. O. D. shipments made to these parties are often refused, and where such shipments consist of cut flowers the loss to the shipper is nearly or quite total.

IN THIS ISSUE we publish a list of the florists' clubs and societies of America, giving name and address of the president and secretary of each, and some other facts of interest. This provides a ready means of communication with all the clubs that will, we hope, be utilized, and result in bringing these organizations into closer relations with each other.

YOU CAN give the AMERICAN FLORIST your fullest support by confining your orders to those who advertise in its columns, and when ordering mentioning the fact that you were induced to order by the adv. in the FLORIST.

IF WE have omitted any existing Florist Club or Society from the directory published in this issue we ask to be advised of same that the directory may be made full and complete.

PLEASE mention the AMERICAN FLORIST every time you write to an advertiser in these columns.

WHEN sending us small amounts in postage stamps, please select those of the 2-cent denomination.

F. BARTELDES, Lawrence, Kan., president; A. L. DON, New York, secretary and treasurer. The tenth annual meeting at Hartford, Conn., second Tuesday in June, 1892. Applications for membership should be addressed to Wm. Meggatt, chairman membership committee, Wethersfield, Conn.

Description of a Rare Novelty.

MEESTER A. B.:—Yu remember dat korn yu gif me last Jannuery? Well, I planted him in a pot juist in the haus en he com up rite away, and growd up 4 or 5 feet—so hi! Ven de vetter was worm I set him out in the garden by the summer haus und he clymed, und he clymed *soo* high!! mebbee 40 feet, und covered the summer haus, all to over. By the ground he is very schlim, but up hi he is ticker, I mean de schtem. He growd like a wine und ivery leafs und send out arms every odder way—now, excouse me, don't schtop me,—he is now covered all offer mit de beutifullest large bo-kais of schmall white flowers—och so schweet—it all ofer lookks lvk schnee—you kno vat I mean—white, like in de vinter; very nice, I tel you. You sai it vas a coucomer from Schtanley de African, but I never saw a coucomer grow forty feet long. I like fery much to no, and mine frends also. I can see no coucomers in it, but sometings lik green young chestnut—fery nice and gif me great amousment. I send one of de arms by male; tel me if it vas a coucomer, or vas it a schoke of yours?

P. S. Can I leaf him out all vinter?

P. S. No. 2. Mine dockter say it vas E. Chystis Lumbatos, in Lettin, but mine frend de beutcher says it vas a vild cowcumer, an he ses he ot too no.

Yours trooly,
HANSVONGANSENBLINKENSTUFFER,
Philadelphia.

MINNEAPOLIS will have a new farmers' and gardeners' market. It will be located near the West Hotel and occupy three or four squares. The matter is a private enterprise.

MR. GEORGE HASKELL, who has been in failing health for some time, died the morning of August 12.

MR. AND MRS. S. Y. HAINES, of Minneapolis, spent a week's vacation in and about Chicago.

KANSAS reports seed crops to date in fair condition, with corn rather below average.

FRANK T. EMERSON visited Chicago August 5.

Fuchsia Gracilis.

ED. AM. FLORIST:—We send you by this mail a plant of Fuchsia gracilis taken from the open ground, where it was planted in a row after the close of spring sales. These plants stand in the full sunshine and have had only the most ordinary culture and they now stand 6 to 10 inches high and spread somewhat wider than that, making a line of color quite conspicuous, even at some distance away. This fuchsia is said by good authority to be hardy with protection, and we propose to give a portion of these plants a moderate covering and leave them out over winter as a test. I think this fuchsia has great capabilities. It is the easiest to grow and the most rapid growing of all fuchsias and can be used for a line of color as described above, as a border in a vase or stand of plants, in hanging baskets or as pot plants and it is also useful as a cut flower. We have a stand of fuchsias under a tree, and bordered it with spring grown plants of F. gracilis, which now have stems two feet long drooping toward the ground and full of flowers. We also have a two year plant in a pot, standing full four feet high and with a stem only one-fourth inch in diameter at the base, making a beaatiful little tree with a spread of 18 inches and full of its delicate little flowers. WM. F. BASSETT.

Hammonton, N. J.

[We agree with our correspondent that the value of this fuchsia is not thoroughly appreciated. The profusion with which its charming little flowers are borne, and its grace of habit, combine to make it an object of great beauty. As to its hardiness, we do not know. The result of Mr. B.'s experiment in this direction will be of interest.—ED.]

Tempering Hydrant Water.

The best method of tempering hydrant water is to use an ordinary range boiler. Place the boiler on the hot water pipes, connect the boiler, so the water from the hydrant enters at one end and have your outlet at the other end. A 50 gallon boiler will be large enough for a house 100x20 feet. The water that stands in the boiler becomes hot, but when you draw from it the cold water at once begins to enter, and the hot and cold water mix. You get the force of the city water just as strong with the boiler attached as without it. I have used this method for six years and it has given excellent satisfaction. Frequently these boilers can be obtained from plumbers at considerably reduced rates when a little rusty, which latter does not at all injure them for our purpose, which is utility and not ornament; I have bought them for $2 under such circumstances. You can have a boiler in each house and get the pressure of the city water just the same.

Orange, N. J. JOHN MCGOWAN.

SITUATIONS, WANTS, FOR SALE.

Advertisements under this head will be inserted at the rate of 10 cents a line (seven words) each insertion. Cash must accompany order. Plant advs. not admitted under this head.

CHICAGO.

PANSIES.

PANSIES THAT ARE UP. Up and ready to plant when I send them. It is not only the plants that are up, the strain is up as well; up to, and most of my customers say, above any strain in the market. The price is down, considering the quality. Seed as good would cost you about as much per 1000 plants.

Price, free by mail, 100 for 75c; 500, $3; by express, $5 per 1000, with discount on large orders.

TRY THEM. THEY ARE WORTH A TRIAL.
SEND FOR LIST AND SHORT PAPER ON CULTURE.

SMILAX.

Plants have been growing, but the price has not; they are nice and stocky and ready to go right ahead. There is some 15,000 left. Let me have a chance to fill your order and do not delay it too long. Price $1.50 per 100; $12 50 per 1000, cash with the order. Sample for 10 cents.

THEO. BOCK,
HAMILTON, OHIO.
Mention American Florist.

New Geranium Omaha.

ED. AM. FLORIST:—Herewith I send you some leaves of a new geranium (Omaha), which I have grown for two seasons with most satisfactory results. The leaves are larger than those of Mme. Salleroi, with deep sinuses, and show as much if not more white than Mountain of Snow. We have had a wet season, with hot and sultry intervals, and yet this geranium has not damped a particle. I am growing it en masse.

W. R. ADAMS, Sup't Parks.

Omaha, Neb.

[The leaves sent were of very large size for this class of geraniums, deeply cut and strongly variegated, as above described. If it does as well elsewhere as at Omaha it will certainly prove a useful addition to our list of this class of bedding geraniums.—ED.]

Smilax and Clematis.

How long will a smilax bed last? Will we get better strings by replanting now with young plants than we can from an old bed which has been in use for three years?

Which is the best way to propagate the large flowering clematis and when is the proper time? SUBSCRIBER.

ROSES.

A very large stock of young Roses of the leading bedding and forcing varieties. Also large stock of same in 5 and 6-inch pots.

The best and newest of **CHRYSANTHEMUMS, CARNATIONS** and general greenhouse stock.

Trade list mailed on application.

JACOB SCHULZ,
Louisville, Ky.

IMPORTED H. P. ROSES,

Worked low on the Manetti Stock, offer the best results to the florist blooming freely and giving plenty of cuttings for propagating quickly. Fine plants for sale by the 100 or 1000, at low rates.

EXCELSIOR STANDARD FLOWER POTS,

With Patent Ventilated and Perfect Drainage Bottom.

CARD. We beg leave to call your attention to our EXCELSIOR STANDARD POTS. You cannot well afford to be without them, as they are especially adapted for growing Chrysanthemums and all valuable plants.

FIRST CLASS CERTIFICATE OF MERIT AWARDED WHEREVER SHOWN.

We still carry in stock a full line of the regular "STANDARD" POTS.

When writing for price list state sizes and quantity wanted.

Price List sent on application to

THE WHILLDIN POTTERY CO., 713 & 715 WHARTON STREET, Philadelphia, Pa.

AHEAD OF EVERYTHING.

We Follow None, Prize or No Prize.

Our latest improvements in machinery produce a Standard Pot which for lightness, smoothness and durability, has never been equaled. Customers buying of us will

SAVE ONE-THIRD IN FREIGHT.

And to prove this, we give below a table showing number in Crate and WEIGHT of same, which speaks for itself:

Size.	No. in Crate.	Weight.
1¾-inch	3,000	250 lbs.
2 "	2,400	250 "
2¼ "	1,750	250 "
2½ "	1,450	250 "
3 "	1,280	350 "
3½ "	800	350 "
4 "	600	350 "

It will be seen at a glance, that our pots are one third lighter than formerly, and yet we claim that owing to the superior quality of our clay and improved machinery, they are stronger than any pot in the market, and we frankly ask you to make the test. ☞ SEND FOR PRICES.

AMERICAN FLORIST CO., Chicago.

Buffalo.

Prospects of a good attendance at Toronto from this city.

Chas. Keitsch's face is radiant. It's a girl and weighs seven pounds.

The local papers have it that W. J. Palmer, Jr., is soon to lead a fair Buffalonian to the altar, and Miss Marie Olin, for years the popular accountant in Long's store, has resigned, to be wedded on the 17th inst. Matrimony is in the air.

Wm. Scott has a fine show of gloxinias now. Fine ones—the envy and talk of the town.

Continued showers and fairly cool weather has made all outdoor blooms plenty, cheap and of good quality.

Trade dwindles each season, more people going away and remaining longer; scarcely any entertaining is done.

As Mr. Craig said of another game, "Great Scott, what a base-ball game it was!" This one was played the afternoon of Saturday, August 1. The opposing forces were the west side and the east side florists. The leading stores were closed for the occasion and the attendance was large. Among the visitors was Walter Mott, of Philadelphia, who graciously acted as umpire. Following is a list of the players:

EAST SIDE.	WEST SIDE.
P, Mesmer	P, Bloy
C, Anderson	C, A. Scott
1st B, W. Milley	1st B, Kromerick
2nd " Troup	2nd " Hazelton
3rd " Bishof	3rd " P. Scott
S S, Jones	S S, "Great Scott"
R F, Mepsted	R F, Buxton
C F, Asmus	C F, Rebstock
L F, Lewis	L F, Nolan

The pitching and catching displayed on both sides would put to blush many professional teams, the players being retired seven times on the one-two-three order; three times but four men faced the bat; five tried it four times, and six—the highest—three times. The west being in the ascendant, the last half of the ninth inning was not played.

The umpire's decisions called forth much foot and leg action of a calibre more vociferous by far than becoming to a guest of Buffalo, and Walter's appeal to the sympathetic managers resulted in relief by W. A. Adams being elected to umpire each alternate inning.

The applause when earned runs were made was loud and lengthy and was only exceeded in volume of sound by the vehement railings, groans and dissenting shouts made against the decisions of the guileless and tranquil umpires. Andy Adams' crippled leg did not incapacitate him a whit for umpiring. Compared with his size he possesses grit quite enough for two umpires.

The Scotts seemed to be the mascots, three of the six runs on the winning side being made by that family. Safe hits were made by both Wm. Scott and Rebstock on their first facing the bat. Mepsted's catch of a hot liner in the second inning was remarkable and is good for six months of glory.

The refreshment tent was well patronized at the close reminding one of a floral display in the hands of a liberal public ten minutes after the closing hour of the show.

A return challenge for the east side is spoken of for the 29th. L. B. D.

When writing to advertisers please mention the fact that you were induced to write by the advertisement in the American Florist. You will benefit us by letting advertisers know that it is the Florist that is bringing them trade.

THE CHEAPEST AND BEST OF ALL.

FIR-TREE OIL INSECTICIDE—soluble.

FOR PLANTS.—To make a solution for washing or cleansing purposes—Half-a-Pint of Fir-Tree Oil to ten gallons of water.

For Green and Black Fly, Thrip, American Blight, Wooly Aphis, etc.—Half-a-pint of the Fir-Tree Oil to two or four gallons of water, or two or three tablespoonfuls to the pint.

For Red Spider and Caterpillar—Half-a-pint of the Fir-Tree Oil to two gallons of water, or three tablespoonfuls to the pint.

For Mealy Bug, Brown or White Scale—Half-a-Pint of the Fir-Tree Oil to four or six quarts of water, four to eight tablespoonfuls to the pint.

For Mildew and Blight on Fruit or Foliage—Half-a-Pint of the Fir-Tree Oil to a gallon of water, or six tablespoonfuls to the pint.

Used with warm water it is quicker in its action than when cold is used.

Soft or rain water is necessary, and Applied in Wood, Tin or Pot Vessels.—Galvanized Iron Vessels must not be used.

FOR ANIMALS.—For Skin Diseases and Killing Vermin mix one part of Fir-Tree Oil with three parts of warm water and wet the affected part each day. In some cases it may be used stronger For Ring-worm apply full strength with a brush each day.

FOR BIRDS INFECTED WITH PARASITES.—Put a tablespoonful of Fir-Tree Oil in one quart of warm water and dip the bird in it, taking care that its eyes are protected, hold the bird in one hand for one minute, then dip into clean tepid water; this may be repeated. If necessary a much weaker solution may be used with a spray producer.

Sold in Bottles and Tins.

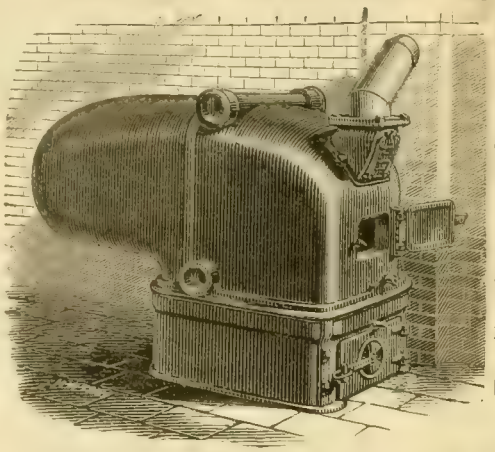
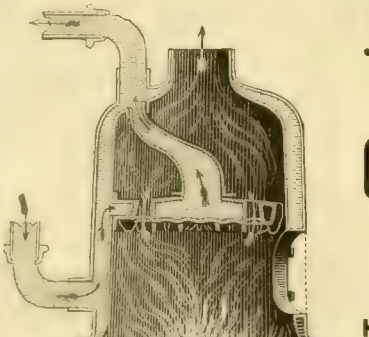
A WRITER in a Boston daily speaks of the hollyhock as "the church steeple of the floral world."

AS WE GO to press we learn that Mr. J. M. Samuels has been named as Chief of the Hort. Dep't of the World's Fair, and confirmed by the Board of Control. The local directory will pass upon the nomination at the meeting tomorrow (Friday).



THE twenty-third biennial meeting of the American Pomological Society, which will be held at Washington September 22 to 24 inclusive, promises to be a most interesting session of that body. The city of Washington was selected on the special invitation of the Secretary of Agriculture, and the meetings will be held in the hall of the National Museum.

Express Rates.



Why is there so little said in regard to the high rates charged by express companies? It is a serious hinderance to the retail dealer, especially in the south and west, where plants have to be shipped long distances. Cannot something be done by the combined efforts of the florists of this United States? At least is it not worth a trial? If we make no demands we cannot reasonably expect the companies to do anything. Let us hear from our brother florists on the subject while at Toronto.

Bureau of Information—Mr. George Vair, care Sir D. S. McPherson's Chestnut Park, Toronto, Ont.

FF FOR TORONTO

Boston to Toronto.

Very low rates have been secured over the Canadian Pacific railroad, and no certificates will be required in order to secure reduced fares. The route is over the southern division of the Boston & Maine (formerly the Boston & Lowell) through Lowell, Nashua, Manchester and Concord to Newport, Vt., and thence by Canadian Pacific railroad via Montreal, where it is expected that the Montreal delegation will join the Boston party and accompany them to Toronto. The party will leave Boston at 9 A. M. Monday, August 17, going through without stop, and arriving at Toronto early Tuesday morning, the opening day of the convention.

Philadelphia to Toronto.

The Florists' Club of Philadelphia has decided to go by the Pennsylvania road via Lancaster, Harrisburg, Williamsport, Watkins Glen, Niagara Falls and through by all rail to Toronto. A special parlor and sleeping coach, together with a combination baggage and passenger car, will take the party through without change.

Delegates from Baltimore, Washington and points south can join the party at Harrisburg.

The train will leave Broad street station 8:50 A. M. Monday, Aug. 17. The fare will be full rate going and one-third returning on presentation of certificate in the regular way.

New York to Toronto.

The New York delegation to the Toronto convention will take the train leaving New York at 5 P. M., August 17, on the West Shore railroad. The route will be to Lewiston on the Niagara river by rail, thence down the Niagara and across the lake by boat to Toronto, arriving there at 10:30 A. M. on Tuesday. Fare from New York and return $12.70, on the certificate plan.

Chicago to Toronto.

The rate from Chicago to Toronto and return, via the Niagara Falls Short Line and the Canadian Pacific, will be $16.60. Train leaves Dearborn station at 3 P. M. August 17, and reaches Toronto at 8:45 A. M. on the 18th. Special sleepers will be provided, and there will be no change of cars. Florists in the west and northwest are invited to travel with the party from this point.

Society of American Florists.

PROGRAMME TORONTO MEETING.

TUESDAY, AUG. 18, 1891.

FIRST DAY—Opening Session, 11 o'clock, A. M.

ADDRESS OF WELCOME—RESPONSE, JUDGE C. W. HOITT, OF NASHUA, N. H.—PRESIDENT NORTON'S ADDRESS—REPORTS: SECRETARY; TREASURER; STANDING COMMITTEES AND SPECIAL COMMITTEES—MISCELLANEOUS BUSINESS—DISCUSSION OF PRESIDENT'S ADDRESS.

There will be a delegate meeting of gardeners' and florists' clubs at 2:00 P. M.

FIRST DAY—Evening Session, 7:30 o'clock.

ESSAY—The Future of Floriculture in America, W. A. MANDA, Short Hills, N. J.

Review of New Plants—WM. FALCONER, Glen Cove, N. Y.

The Question Box. (*See below.*)

WEDNESDAY, AUGUST 19, 1891.

SECOND DAY—Morning Session, 10 o'clock.

Selection of place of meeting and nomination of officers for 1892.

ESSAY—Sub-Tropical Bedding, DAVID ALLAN, Mt. Auburn, Mass.

ESSAY—Aquatic Plants, BENJ. GREY, Malden, Mass.

ESSAY—Begonias; Flowering and foliage; their value as bedding and decorative plants, JOHN CHAMBERS, Toronto, Ont.

Election of state vice-presidents by state delegations after close of morning session. The bowling contest will take place on this afternoon, place and hour to be announced hereafter.

SECOND DAY—Evening.

The evening of Wednesday, August 19, will be devoted to the annual meetings of the following auxiliary societies:

The Florists' Protective Association will meet at 7 P. M. H. B. BEATTY, Oil City, Pa., sec'y.

The Florists' Hail Association will meet at 8:30 P. M. JOHN G. ESLER, Saddle River, N. J., Sec'y.

THURSDAY, AUGUST 20, 1891.

The American Chrysanthemum Society will meet at 9 A. M.

THIRD DAY—Morning Session, 10 o'clock.

Election of officers.

ESSAY—Credits, H. B. BEATTY, Oil City, Pa.

ESSAY—Store Trade, Wm. H. Long, Boston, Mass.

ESSAY—Winter Flowering Plants Suitable for Decorations, W. H. TAPLIN, Holmesburg, Pa.

THIRD DAY—Evening Session, 7:30 o'clock.

ESSAY—Carnations to Date, FRED DORNER, Lafayette, Ind.

Question Box. (See below.)

Final Committee Reports.

QUESTION BOX.

The following subjects for the Question Box have been already sent in, and together with those placed in the box during the sessions will be assigned to gentlemen competent to reply to them on

the evenings of the first and third day. The questions will be grouped as nearly as possible, so that subjects of general interest to the trade will be assigned to the first evening. Strictly cultural questions and those relating to mechanical appliances in greenhouses will be assigned to the third evening. Five minutes will be allowed for each reply.

SUBJECTS.

Should Florists Charge for Boxing and Packing?

How Can We Best Profit by the Demand at special seasons?

Is Miscellaneous Advertising in the Retail trade Advisable?

How to Successfully Manage Floral Exhibitions?

What Are the Best Twenty Foliage Plants and the Best Twenty Flowering Plants for Decorative Gardening.

What are the Best Twelve Companions to India Rubbers and Latanias for House Decoration?

New Ideas in Greenhouse Construction and Heating?

Best Method of Tempering Hydrant Water?

Best Method of Distributing Liquid Manure?

Growing Roses for Summer Use?

The Best Varieties of Gladiolus for Forcing?

How to Master the Green Fly?

How to Mend a Rubber Hose?

FRIDAY, AUG. 21, 1891.

FOURTH DAY,

An excursion on Lake Ontario by invitation of the Gardeners' and Florists' Club of Toronto.

The Entertainment Programme.

TUESDAY, Ladies' Drive, Etc.

Hacks will start from Queen's Hotel at 2 P. M. sharp, pass principal streets, public buildings, private residences, etc., leaving the visitors on the ferry wharf. Ferries will take them to the Island Park, where light refreshments will be served and a military band will be in attendance. The ferries run to and fro every quarter of an hour.

WEDNESDAY, Garden Party at Rosedale, tendered by Alderman Hallam.

Members will take the Sherbourne street cars at 2 P. M., and ride to the end of the track. The cars start from the corner of York and Front streets near the Queen's Hotel, running up York to King and along King to Sherbourne, passing close to all the principal hotels. From the end of track to Alderman Hallam's residence 'busses will convey all who wish to ride the remaining distance of three-fourths of a mile.

THURSDAY, Bowling Contest.

At the Victoria Club, 265 Huron street, at 2 P. M. Take McCaul street or Spadina and Bloor or Carlton and College cars.

FRIDAY, Entertainment Tendered by the City and the Gardeners and Florists of Toronto.

Steamboat will leave wharf at foot of Yonge street at 11 A. M. sharp, and after a sail on the lake will leave the members at the exhibition grounds, where lunch will be served in the Annex building, after which there will be games of cricket, base ball and quoits. King street or Queen street cars will convey passengers back to the city. The exhibition grounds are two miles from center of city.

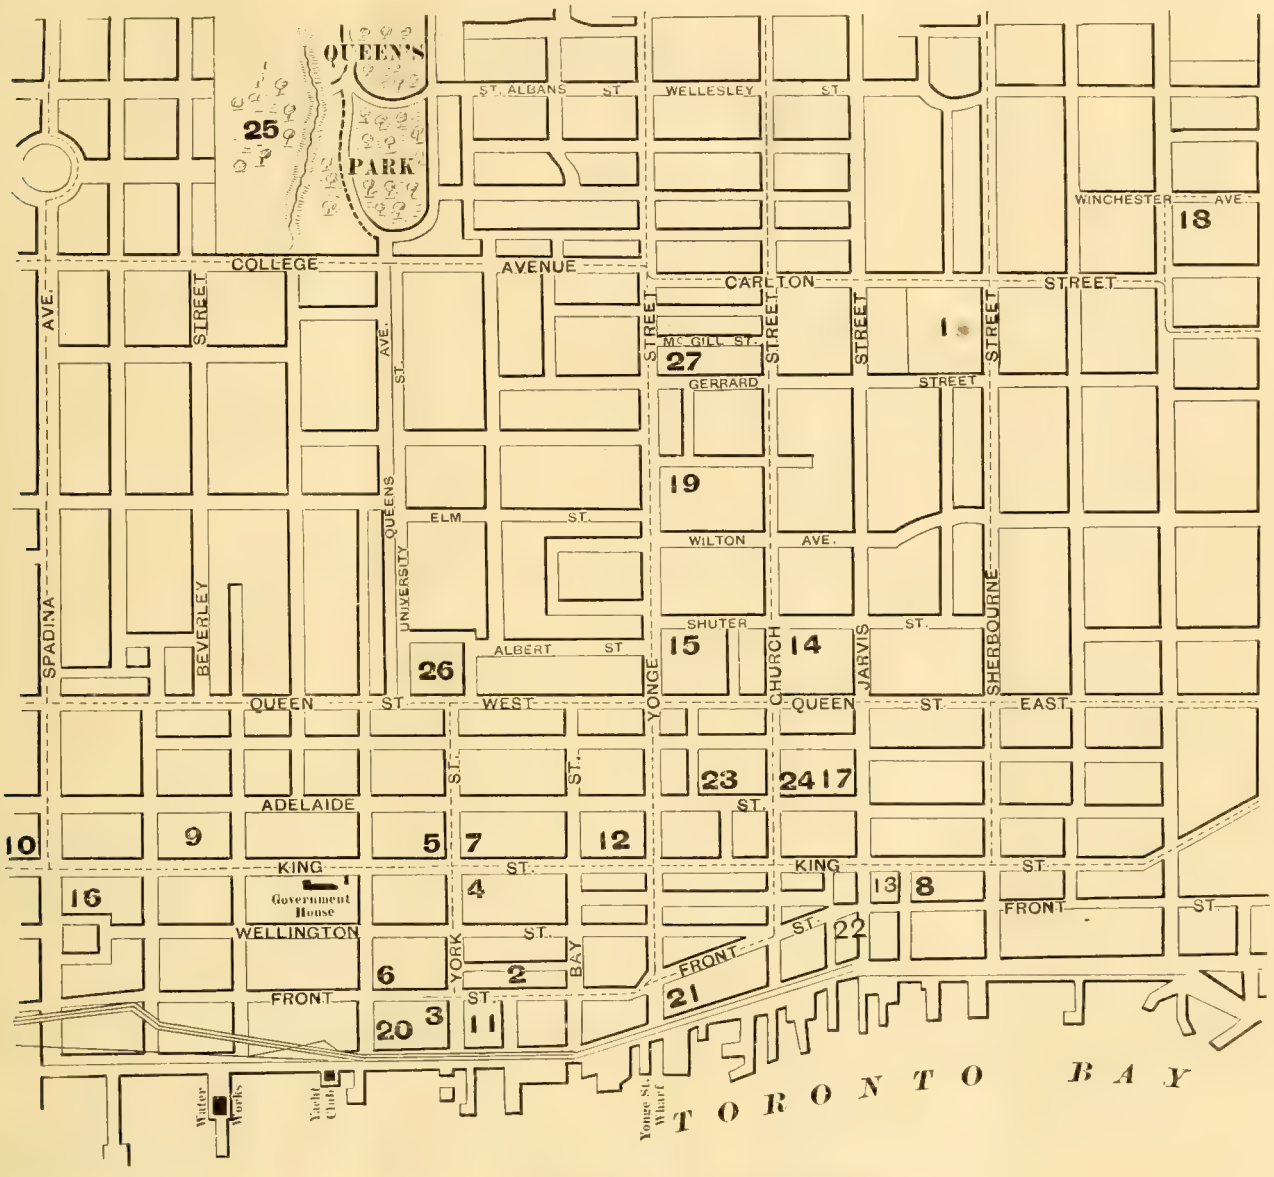
WHEN you write an advertiser tell him that you saw his advertisement in the AMERICAN FLORIST.

THE PRIZE CUP OFFERED BY THE GARDENERS' AND FLORISTS' CLUB OF TORONTO IN THE BOWLING TOURNAMENT CUP IS SHOWN REDUCED ONE-HALF IN SIZE.

The Bowling Tournament.

The bowling tournament will take place Thursday afternoon at 2 o'clock at the Victoria Club building, 265 Huron street. The contest between the competing teams promises to be spirited and it will undoubtedly furnish much entertainment to onlookers. To reach the club building take McCaul street, or Spadina and Bloor, or Carlton and College cars.

The teams will be composed of five or six men from each club, the number to be determined at the opening of the contest. The Tournament will be conducted under the supervision of Mr. John N. May, who upon the invitation of the Toronto club has kindly consented to act as manager of the affair.



The Toronto club offers as a prize to the winning team the beautiful cup of which we present an engraving, the picture showing the cup reduced one-half in size.

THE RULES.

Each club to roll two full games of ten frames each, changing alleys each game. At the close, the club having made the highest total score shall be the winner of the cup. In event of any two clubs making a tie of the highest scores, each club so tying shall roll one full game each to decide the game and the club making the highest score shall be the winner. The general rules governing the whole will be what are known as the revised rules of the National Bowlers' Association.

Each club entering must elect or appoint a captain for their team, with whom all disputes (if any) regarding the breaking of rules, etc., will be settled by the umpire.

Any further information desired may be

MAP OF CENTRAL PART OF TORONTO.

had from the manager of the tournament, Mr. John N. May, who may be seen at the Queen's Hotel.

During the afternoon Mr. W. J. Laing will dispense "bannoes" and lemonade at his greenhouses, three blocks from the bowling alleys and invites all to partake of his hospitality. We give the word "bannoes" as received in a late telegram. It may be some kind of fruit, a prohibition drink, or a "strike" ball, but whatever it is, it must be well worth discussing when W. J. L. telegraphs us to "hold the press a minute" in order to make the announcement. Our advice to the bowlers is don't "go to press" until you have had some of the "bannoes." They may be the mascotte you need.

DELEGATES from points in the territory of the Central Passenger Association (west of Pittsburg and east of St. Louis) should not forget that their railroad certificates must be vised by the representative of the association as well as by Secretary Stewart. The representative of the association will be at the convention hall during the sessions of the society and at the Queen's Hotel at other times, on Thursday and Friday. The certificates will be valueless without the signature of this representative of the railroads which are members of the Central Passenger Association. Certificates from points outside the territory of this association need only the signature of Secretary Stewart.

Boston Gossip.

Boston will show up in fine style at Toronto. Everybody is going. And there will be an unusual number of ladies in the party. This will help to make the company happy, especially Zirngiebel. All the heavy men will be there, Norton, Cox, Comley, Ewell and lots of 200 pounders. Warren Ewell is proud of his agility as well as his strength. He says, "there are few men as heavy as I am who will weigh as much."

It is whispered that if it were not for the great bowling contest the delegation would be smaller by considerable. But never mind what the attraction may be, so long as we get them. I should not wonder if the sensation of getting under the old flag just once more is a big magnet for some of the boys, even if they have, many of them, thrown off their allegiance to Her Majesty and placed themselves under the protection of the Stars and Stripes for the remainder of their lives.

Perhaps there is a little local pride too, for is not the worthy president a native Boston boy? And then there are to be essays by Davie Allan on "Sub-tropical Bedding," by W. H. Long on "Store Trade" and by

Ben Grey on his favorite subject, "Aquatics." So with all these inducements is it surprising that there will be nobody left at home except those who unfortunately cannot go and the few old moss backs and scoffers who are always to be found in any well regulated community?

It looks as if President Norton would be fully recovered from that lameness by the time the train is ready for Toronto. It has been a source of much annoyance to him and amusement to his friends, who don't often get such a good opportunity to chaff him. But he says "he don't care so long as it happened at home; that's all that saved me."

That August meeting of the Gardeners' and Florists' Club was not a bad one.

Lawrence Cotter was in a generous mood and wanted the Club to pay all the expenses of the delegates to the Florist Club meeting at Toronto. But Lawrence's eloquence was unavailing, for he was promptly voted down, and the delegates will pay their own bills.

Chairman Elliott, of the late excursion committee, got his report in in his usual leisurely manner and it was accepted without comment. Elliott takes his time and is never in a hurry, but he generally manages to get there all the same.

Skipper McCarthy, one of the heroes of the recent boat episode, came in late, but was soon engaged with Warren Ewell in an animated argument as to the value of the latter as ballast on that memorable occasion. Tom Cox refused to be convinced of the wisdom of taking the ladies on the annual excursion, but he had his side of the argument all to himself. Lit-'Lijah Wood was skipping around as nimble as ever and couldn't let chrysanthemums alone for five minutes at a time.

A letter from J. N. May, anouncing that he had been entrusted with the duty of managing the coming bowling contest, was read, and gave much encouragement. Sam Coleman, chairman of the bowling committee, reported progress and gave a good account of phenomenal scores that have come to be the regular average with some members of his team.

I wonder what Elijah Wood meant by addressing President Foster as "Noble Grand." Perhaps he will tell us some time.

W. J. S.

A MIGHTY EFFORT FOR THE CUP.

RENEW YOUR subscription while at the convention.

MR. G. E. BRIGGS, chairman of the Printing and Badge Committee, is going to decorate the "boys" with a very pretty and neat badge.

THOSE WHO don't roll on Thursday will probably roam as "*chacun a son gout.*" There will be no "rolling home in the morning boys."

MR. GEO. VAIR is the "Bureau of Information," the club intends making him conspicuous by a large badge back and front, like the sandwich men, (if he doesn't object).

IT IS WHISPERED that Mr. Harry Dale intends running special trains out to his establishment at Brampton during convention week. Mr. D. has been making very extensive additions to his establishment this year.

THE BOWLERS are likely to have a good time at the Victoria Club Alleys, Huron street. It is situated in the residential part of the city. Everything connected with the Victoria Club is done in good style. Play begins at 2 P. M. Thursday, the 20th.

A BIG DEAL.

We have just received per Steamer "Neustria" 31 Cases containing

15,000 BLACK CALLAS.

also called **Arum Sanctum, and Solomon's Lily.** This shipment places us in control of the entire available stock of this valuable variety. Last year not one-tenth of the demand could be supplied, and yet dry bulbs were catalogued at **$2 each.**

It is a most magnificent flower, over a foot long and five to six inches wide; color the richest purple-black imaginable, while the spadix which rises to a height of 10 to 12 inches is as black as soot. The flowers are **DELIGHTFULLY FRAGRANT,** and as freely produced as the ordinary White Calla. If potted now will bloom before Christmas.

PRICE, $40 PER 100; $6 FOR 12.

Send for Wholesale List of some bulbs not offered by others in the trade.
Also for Catalogue of **Cacti.**

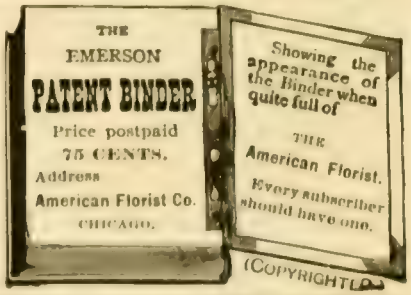
ELECTROTYPES FOR ILLUSTRATING CATALOGUES. Send for sample sheet and list of catalogues, **A. BLANC, Philadelphia, Pa.**

WHY You Should Grow Mushrooms.
Because they are the most profitable crop for the outlay that can be grown and may be grown without interfering with other crops. The market is sure, the supply never having been equal to demand.

WHEN You Should Grow Mushrooms.
During the Winter and Spring months, the first planting in August or September with successional planting until April.

WHERE You Should Grow Mushrooms.
Under the greenhouse benches, on the greenhouse benches among growing crops, in Rose Houses, in frames in the greenhouse, in cellars, stables or outhouses, in the open field or in mushroom houses.



How You Should Grow Mushrooms.

First get spawn that will grow. It must be fresh, well spawned, and in good condition. **Gardiner's Celebrated English Mushroom Spawn** is the best, and is always fresh and reliable. The details of culture are given concisely in our treatise, **"Mushrooms for the Million,"** Mailed free. **Falconer's "Mushrooms and How to Grow Them."** Published at $1.50. (Gardiner's price $1 35 post free.) **Robinson's "Mushroom Culture,"** 50 cts. postpaid.

GARDINER'S ENGLISH MUSHROOM SPAWN.
John Gardiner & Co., have made a specialty of choice spawn for years, and their celebrated English brand (made by the best maker in England, specially for their trade), has gained an enviable reputation among critical growers for its uniform good quality, and can be thoroughly relied on to produce a good crop of the best mushrooms. Orders booked now for delivery as wanted, $3.00 per 100 lbs. Special rates to large growers. Address all correspondence to **21 North Thirteenth Street,** Philadelphia, Pa.

SURPLUS STOCK OF ROSES FOR WINTER FLOWERING

WHICH WE OFFER VERY CHEAP, UNTIL SOLD.

American Beauty, Bride, Perle des Jardins, Mermet, and Mme. Cusin,

Grown in 3½-inch pots.

Our stock of these is in exceptionally fine shape, very healthy and in the best possible condition for planting. It is the same stock we use for our own planting, but grown in excess of our own wants. They are entirely free from mildew. The American Beauty is free from black spot, and all are in perfect health and perfect condition in every respect. Buyers will find it to their advantage to inspect our stock before purchasing. Write for prices.

WE EXCEL IN AMERICAN BEAUTY, WHICH IS A SPECIALTY WITH US, AND OF WHICH WE HAVE A LARGE STOCK.

We obtained first prize, two consecutive days, above all competitors for our exhibit of "American Beauty" at the flower show of the New York Florists' Club, held at the Lenox Lyceum in New York City, in April.

F. R. PIERSON COMPANY,

Tarrytown-on-Hudson, N. Y.

OF IMPORTANCE TO FLORISTS!

HYBRID PERPETUAL ROSES for FORCING

C. Young & Sons Co, 1406 Olive St., St. Louis, Mo.

Summer Propagation.

Two years ago, in getting up stock of my new white carnation "Mrs. Fisher," I rooted several thousand cuttings in July and August. I put the cuttings in boxes of sand, and set them on the ground in a place exposed to the sun, convenient to look after them, shaded with muslin frames, raised so as to allow free circulation of air during the day, and removed at night and on cloudy days. They were watered freely several times a day in fair weather, the boxes of sand being well drained. About 90 per cent of the cuttings rooted in six weeks, of those taken from the greenhouse. Out door cuttings of the same variety failed almost entirely. I have rooted rose and chrysanthemum cuttings in the same way. S. F.

Plants for the World's Fair.

In the AMERICAN FLORIST for July 16, my friend, John Thorpe, draws attention to the fine specimen azaleas exhibited by Messrs. Veitch and Turner in England from 1862 to 1866. Those plants I well remember and quite agree with Mr. Thorpe that it is worth living half a century to see such plants. Mr. Thorpe also states that we must have some good azaleas at the World's Fair. I think Mr. Thorpe will quite agree with me that it would be a grand addition to have some fine specimen roses grown in pots similar to those that used to be exhibited at the London shows by Messrs. Turner, Lane and Paul, six to eight feet high and from four to six feet across. Such would certainly be grand objects for the World's Fair. JOHN SMITH.

Bayside, L. I.

FOR FALL 1891

I offer more than

1,500,000

Lily of the Valley Pips,

Three Years Old, BEST ASSORTED.

GARDINER'S SUPERB CHINESE PRIMULAS.

The Chinese Primula has long been a favorite florist's flower, and it has never been seen in greater perfection than now—some very rare and remarkable varieties having been produced within the past few years. Our strain is from a celebrated European specialist, and is acknowledged to be superior to all other strains now on the market. The many flattering testimonials we have received warrants us in recommending this strain very highly.

Zirngiebel New Giant Pansies.

Huge jewels of velvet and gold.—Boston Transcript.

The Result of Forty Years' Experience at Growing Pansies.

Zirngiebel New Giant Pansies have opened a new era in Pansies. The magnificent specimens that we have exhibited and sent to Boston, New York, Philadelphia, Detroit, Hartford, Baltimore, Chicago, etc., etc., have shown to what perfection of color and size the Pansy of to day can attain when well grown. The display we made on May 10 in Boston has probably never been equaled even in Europe, not a few of the flowers measuring four inches across and colors rivaling the best orchids.

OUR GIANT MARKET

Is truly the variety for the million, being of immense size and bright colors. We have greatly improved them, getting more variety of colors, especially in the lighter shades. 1500 seeds.

THE GIANT FANCY

We find it impossible to improve on. They are certainly the ne plus ultra in pansies now. They require high cultivation to develop well. 600 seeds. Trade packages of either variety at $1 each.

Full directions how to grow pansies with each package.

Very Flattering Testimonials From the Trade all Over the Country.

ORIGINAL AND LARGEST GROWERS OF

LILIUM HARRISII, BETTER KNOWN AS THE BERMUDA EASTER LILY.

BULBS NOW READY FOR DELIVERY.

THE BEST IN THE WORLD FOR FORCING FOR WINTER FLOWERS. WE OFFER ONLY STRONG FIELD-GROWN BULBS FROM OUR OWN GROUNDS IN BERMUDA.

COPYRIGHTED, 1890, BY F. R. PIERSON, TARRYTOWN, N. Y.

From a photograph taken the week before Easter, 1890, showing a view in one of our new iron greenhouses, here at Tarrytown, 20 feet in width by 140 in length, of a crop of Lilium Harrisii in full bloom. This house produced over 15,000 flowers for Easter.

This is not only the best by far of all lilies for winter blooming, but it is one of the most profitable flowers that can be grown by florists. It is very easily handled, and the flowers being especially effective for decorative purposes, always command large prices. From its name some have thought it was a bulb for florists' use for forcing for the Easter market only. This is not exclusively so; it derives its name from the fact that, in Bermuda, grown in the open ground, it blooms at Easter time—hence the name "Bermuda Easter Lily"—but by growing it in this country in the greenhouse, with successive lots, it can be had in bloom all the winter from early in December until after Easter; in fact, by special culture, all the year round, or as long as cut flowers are in demand. The fact that it can be forced into bloom by the Christmas holidays adds particularly to its value, as it fills in at a time when flowers are usually scarce and in great demand at high prices, but to accomplish this the bulb must be potted early in August, something depending upon after treatment and the temperature the bulbs are grown in.

For this purpose our Bermuda-grown bulbs are indispensable, as in Bermuda the bulb reaches its highest development, and ripens off perfectly, and is ready for shipment usually by the middle of July—before bulbs in our own country have hardly begun to make their growth. Our bulbs being grown in the open ground, in a climate naturally adapted for their perfect growth, are particularly strong and healthy at any time.

The extent to which this Lily is being forced for winter flowers will be shown by a sale made by us to a large New York grower, who purchased 20,000 bulbs for his own use. We hear it said occasionally that Lilium Harrisii flowers will not keep—this is owing to improper handling. If cut as soon as open they can be kept for more than two weeks, if in a proper place. It bears shipping splendidly, as the two following letters will show. These were written acknowledging the receipt of flowers shipped last Easter.

J. L. Russell, Denver, Colo., writes: "The Lilies came in excellent shape. I don't think I lost one; it is a pretty good recommendation for your packing."

The Fort Worth Nursery Seed and Canning Co., Dallas, Texas, writes: "The Lilies arrived in perfect condition, and we must compliment you on your packing. We would not have thought they would have carried so far packed dry."

THIS VALUABLE LILY IS OUR SPECIALTY.

We grow the bulbs by the acre on our own grounds in Bermuda. We were the first to grow it in large quantities and to offer it at reasonable prices, and we have always been recognized by the trade as **HEADQUARTERS FOR THE BERMUDA EASTER LILY**: supplying the trade as we do, both in this country and in Europe, and we hold by far the largest and the controlling stock of the genuine variety in the market.

The extent of our operations in this bulb alone will be best understood when we state that we expect to sell from OUR CROP of 1891, over

HALF A MILLION BULBS.

Be sure you get the genuine Lilium Harrisii. In order to secure "the true variety," purchase your Bulbs from original stock, which is known to be pure. The value of this Lily has led unscrupulous or ignorant parties to plant L. Longiflorum in Bermuda, planting it with Harrisii to increase their stock rapidly when Harrisii was very scarce, thus mixing the stock irretrievably, thereby rendering it absolutely valueless for forcing and we have known instances where these mixed bulbs have been sold to large growers as the genuine variety, where large loss has resulted, and dealers should look with suspicion on bulbs offered at prices less than market rates, as the supply has never yet met the demand; "**Mixed Bulbs**" only being offered at reduced rates.

Large growers or dealers in this bulb should write us for special prices, stating quantity of bulbs desired, and we will give lowest estimate on the same by return mail.

F. R. PIERSON COMPANY, TARRYTOWN, NEW YORK, U. S. A.

OUR FREESIA BULBS ARE NOW READY FOR DELIVERY. They are of unusually fine quality, nearly twice the size of Bulbs usually sent out. Intending purchasers should write us for samples and prices, stating quantity wanted.

COULDN'T GO!

DON'T FORGET to call on the AMERICAN FLORIST, Parlor B, Queen's Hotel.

WHEN WRITING advertisers please say that you saw the adv. in the AMERICAN FLORIST.

THE LATEST report of the Florists' Protective Association makes very interesting reading to those who do a credit business.

THE CITY GOVERNMENT of Toronto has joined hands with the Gardener's and Florist's Club to make our stay an enjoyable one.

TAKE A good supply of your business cards along, so new acquaintances may have your name and address in convenient shape for preservation.

AS WILL be noted by the programme printed in this issue the bowling match takes place on Thursday instead of Wednesday as previously announced.

A COMPLETE collection of the engravings that have appeared in the AMERICAN FLORIST, and of which electros are sold at one-fourth the original cost of the engraving, may be seen at Parlor B, Queen's hotel.

YOU WILL get many valuable pointers by a careful inspection of each article displayed at the trade exhibit. This is a progressive age, and here are gathered together the very latest developments in tools and other accessories to the business.

Butted Glass.

We are rebuilding our houses this summer using 12x24 glass, and are butting it, first dipping the lower edge in thick white lead paint, and puttying with Ives' putty machine. We have had several hard showers and find that it is not necessary to "carry an umbrella" in the houses. A. WHITCOMB & SON.

HUGH LOW & CO.

Montreal.

The Florists' and Gardeners' Club held its fourth annual picnic July 29, about 300 persons boarding the steamer Prince of Wales for a trip up the river.

The weather was magnificent (thanks to Professor Perrin) and everyone seemed to thoroughly enjoy themselves, with the exception of Barney (Stanford's dog.) Barney evidently did not enjoy being tied to a tree while his master with two or three others were round at Kirkwood's point fishing. A programme of games was gone through, the children in particular enjoying themselves. Everything passed off without a hitch, the return safely made through the rapids, reaching the city about 7 P. M.

The chrysanthemum bug is around in large numbers and fears are expressed for the crop of bloom. Can any reader of the FLORIST tell us how to keep the plants free of them? Several remedies have been tried here; all without success so far. It is simply impossible to grow plants in the open if something cannot be done to get ahead of his bugship.

Members are commencing to look up a few stray dollars for convention week. Members traveling via Montreal and wanting information as to time, route, etc., can write to Jos. Bennett, 2401 St. Catharine street, who will be pleased to supply any information required. J. B.

To Toronto via Buffalo.

Delegates going via Buffalo will find the last of their trip most enjoyable, if arranged so they go via New York Central railroad to Lewiston, thence by boat across Lake Ontario. The Erie and connecting roads have a similar line, but here the Niagara gorge and rapids view between the Falls and Lewiston is missed.

THE convention programme as it appears in this issue contains some additions and corrections made since the original was issued by the secretary.

AN ANIMATED DISCUSSION ABOUT "THE BLACK SPOT." WITH ACKNOWLEDGEMENTS TO PUCK

The Use of the Putty Bulb.

Four years ago I applied thick paint or thin putty with a Scollay bulb to a portion of my greenhouse on the edges of the glass. At the time I was quite pleased with it, as I could apply faster than ordinary paint with a brush and it made a good joint. Two years after, in painting the house it was in good order. *Now* I am having the pleasure of scraping it off and I lose as much time doing so as I saved putting it on. As the oil has dried out the water has loosened it; the edge curls up and makes it very rough. I paint the outside of the greenhouse once in two years, which preserves it in good order and keeps a tight roof. I have not tried any paint that is more satisfactory on the whole than white lead and linseed oil, but from a partial trial two years ago of a mixture of white lead and sulphate of baryta I am led to try it again this year. It does not rub off as much as lead alone, and it does not crackle like zinc. The experience of florists in painting sash work would I think be useful to many, especially to those who have limited experience. My rule is one coat of paint every two years. S. F.

LITTLE ROCK, ARK.—At a special meeting of the Little Rock Florists' Club held August 12, it was decided to give a chrysanthemum show about the 10th or 13th of November.

YOU CAN give the AMERICAN FLORIST your fullest support by confining your orders to those who advertise in its columns, and when ordering mentioning the fact that you were induced to order by the adv. in the FLORIST.

The Toronto Convention.

The seventh annual meeting of the Society of American Florists began last Tuesday morning in the Pavilion at the Horticultural Gardens, Toronto, Ontario. This was the first meeting of the society held in Canada, and as a result many erroneous impressions regarding the florists, and the people generally, to the north of us, was quickly removed. Toronto is a beautiful city and it does not lack the bustle of a municipality of equal size in the "States". And certainly no warmer welcome could have been extended than that received by those who crossed the line to enjoy the hospitality of our Canadian friends on this occasion.

The very cordial address of welcome extended to the society at the opening session by Mayor Clark, on behalf of our hosts, was very ably and warmly responded to by Judge C. W. Hoitt of Nashua, N. H., on behalf of the sotiety as follows:

RESPONSE TO THE ADDRESS OF WELCOME.

It becomes my duty and pleasure in behalf of the society here assembled, to accept the hospitalities so generously tendered us. It is a duty, because as such spokesman, I am called upon to voice the sentiments of the "strangers within your gates," and to assure you, sirs, that the society fully appreciates the great honor conferred upon it as a whole, and upon the members individually in being so gracefully and cordially received in your beautiful city. I esteem it an honor that I was selected by our president to represent a society, which cannot be characterized in the language of Burke, as, "still, as it were, but in their gristle and not yet hardened into the bone of manhood," but an organization of more than eleven hundred members, residents of forty states, of the three leading provinces of British America, of England, Ireland and France. To occupy such a position, I long, like Byron, for a speech "of forty parson power," but that being denied me, I will proceed as best I may.

It is the first time in the history of the society that it has convened outside the limits of the United States. How fitting that your charming city was chosen! The name itself is a synonym for hospitality, for in the poetic Indian tongue from which it is derived, Toronto signifies the "place of meeting," and in the days long ago, the beautiful site on the lake shore was selected as the rendezvous of the great tribes when called to deliberate on matters of their common welfare. Thus at an early period its natural beauties and advantages were appreciated and time has but added to its charms. This may offer an explanation of the liberal hospitality tendered us here to-day. From the beginning, the good people were accustomed to it.

The city itself from its location and surroundings, offers most extraordinary facilities for such courtesies; it is easily accessible by rail or water, having six or more railways converging from different points of the compass; a fine harbor to which steamers come from all the principal cities on the lakes and the St. Lawrence; with a people thoroughly alive to its advantages and natural surroundings, "framed," as Gloster says, "in all the prodigality of nature." Is it any wonder that the city with such a combination has made the wonderful growth attributed to it? In 1813 we are told the population was but four hundred and fifty-six, in 1885 it was one hundred and twenty thousand, while now the returns show more than two hundred and twenty thousand inhabitants! In assessed valuation in a period of eight years alone, it showed a gain of forty-eight per centum; the people meanwhile keeping pace in all branches, so that to-day, it is the religious, educational, political, literary, legal and commercial center of the most populous province of the Dominion. Well may the citizens be proud to occupy such a position in a country which has been styled, "the principal gem of the girdle of precious stones encircling the waist of Brittania." Most truly may they boast of a province which by the mother country is so esteemed; to which is given the greatest latitude in self-government and in the management of its own affairs; a country of enterprise and progress and though we from the States consider ourselves as lively, progressive and aggressive, yet we find ourselves not a little taxed in all our modern ideas and thoughts to even keep abreast of you.

But a few short months ago there dwelt among you a leader whose ability, tact, good judgment and loyalty marked him as one of the greatest statesmen of modern times, to whose suggestion and advice your queen listened with respectful admiration, one to whom Canada lovingly and loyally paid her grateful tribute, and when over the wires flashed the sad news that he had gone to his reward, all Christendom testified with tender condolences to the worth of "this great, good man." Of such a country, of such prosperity, of such men, this fair land may well be proud.

The horticultural portion has especial reason to congratulate itself for belonging to a nation whose mother country has done so much for the advancement of this branch. To an Englishman, Wm. Kent, we are indebted for the modern style of gardening, differing materially from the Dutch and Italian styles. Horace Walpole spoke of him as "an original, the inventor of an art that realizes painting and improves nature. Mahomet imagined an Elysian; Kent created many." The style of gardening then introduced by him in the eighteenth century was quickly

copied by other nations and extended all over Europe. He was followed by other British artists and the lead then secured has been maintained to the present time.

Again, the London Horticultural Society formed through the efforts of Sir Jos. Banks and two others, obtained its charter in 1808, and nine years later was the first to establish an experimental garden. From this, other societies sprung up until now similar organizations are found in all the leading European cities. In fact, in Great Britain and Ireland alone there are to-day 315 botanical, horticultural and floral societies.

England has produced such botanists as Hooker, Lindley, and Bentham; such hybridizers as Dominy, Bennett, and Waterer; such plantsmen as Veitch, Williams, and Low; such growers as Molyneux, Turner and Laing, and a host of others in each of the above classes who are a source of pride not only to their own country, but to the world.

Such a fatherland have you—to such did our own honored and revered statesman, Daniel Webster, a native of my own little state, refer in a memorable speech in May, 1834, when he said: "A power which for purpose of foreign conquest and subjugation, Rome, in the height of her glory is not to be compared—a power which has dotted over the surface of the whole globe with her possessions and military posts, whose morning drum beat, following the sun and keeping company with the hours, circles the earth with one continuous and unbroken strain of the martial airs of England." Such is the mother country! Such the leading daughter of that parent land! Such is the leading city of one of the principal provinces thereof!

To be in such a city, to be so cordially received by this people, to be privileged to assemble here for carrying out the purposes of our convention is assuredly most flattering and advantageous to us, and while before coming we looked forward to our advent here as one into a foreign land, yet we now appreciate the fact that we were separated by imaginary lines alone, and that we are come to visit not only our friends, but those of our own "kith and kin," and to more closely cement the common bonds which unite us.

We most heartily accept your hospitalities, and tender you our grateful thanks.

President Norton's Address.

MR. PRESIDENT, LADIES AND GENTLEMEN, MEMBERS OF THE SOCIETY OF AMERICAN FLORISTS:

For the first time in the history of this society, by the kind invitation of the Toronto Gardeners' and Florists' Club, we meet outside the limits of the United States, and I assure you it is a pleasant duty for me to preside in accordance with your choice, to open the business part of the convention in this beautiful and thrifty city.

Our meetings are for the purpose of promoting and advancing the interests of our members; with that end in view we convene to deliberate and glean knowledge that will be of interest and value to us.

It is very gratifying to be able to state that our membership is still increasing, that we have more money in the treasury than at any time since the organization of the society seven years ago; that the several committees have attended to their duties earnestly and promptly with very satisfactory results, which will appear in their reports during the session.

The committee on nomenclature, composed as it is of the most able and intelligent of our members, has already exerted a salutary influence and cannot help being a great benefit to the cause of horticulture generally. The very existence of this committee has a healthy effect, and it is a constant reminder to evil doers that the society has its eye on them. Let the good work go on until every purchaser can feel sure of receiving what he orders, and that whatever he buys, let it be seeds or plants, will prove to be just what the description or the illustration represents it to be.

In the way of recommendations to the society, I find it difficult to say anything that is new or to find any ground that has not been pretty thoroughly gone over by such able and intelligent predecessors as Thorpe, Craig, Hill, May and Jordan, who together with many others whose names are prominent in this society have said and written so much that is valuable and useful to us.

To the young man with visions of future prosperity, who aims to become a successful gardener or florist, I would say, do not forget that it is not so much the opportunities as the use made of them that tells in the end. Good honest toil during working hours together with that intelligence which can only be obtained by study during leisure, will give you the reputation of being faithful and industrious. While I believe recreation after working hours to be necessary and desirable, yet to devote every evening during the week to pleasure is a neglect of opportunities which is sure to be felt in after years, and will do much to blight the hopes of ambitious young men. Constant work without intelligence may become a burden, but with it work will be turned into pleasure and profit.

A proper use of opportunities—and many will present themselves—will certainly bring a reward in later years, for when he enters business for himself he will have that practical experience combined with good common sense which will save him from many annoying mistakes and discouraging failures, and in addition to pecuniary success he will also have that respect which is only accorded to men of refinement and education.

I would say to the beginner as a florist, in the first place to make his business a success a man must be bright and active and smart enough to succeed in any business in which he might take an interest; he must also have a love for his business.

The tendency now is to grow specialties. Some take to roses, and a very few varieties; others to carnations and violets; others to bulbs and chrysanthemums, and many to bedding, stove and greenhouse plants. The first thing to be done is to decide on what you wish to make a specialty of, for, as a rule, the greatest success is attained by having one principal money crop. Then choose a good location where the soil is best adapted for the particular plants you wish to grow. Be sure and locate near a railroad station or within easy access to the nearest market, then erect such houses as are best fitted for the plants you take a live interest in. That florist will succeed best who will take the greatest care in preparing his flowers for the market, culling out and throwing away the poor ones. Far too many of the ordinary or inferior class of flowers are grown. There has been, however, a wonderful improvement in the quality, more especially with roses, chrysanthemums and carnations. Who would have thought a few years ago that those flowers would sell for such high prices as they brought the past season. It only shows that the public are willing to pay for a good article, and the florist who makes quality rather than quantity his first consideration will always have a ready market with satisfactory prices. The wholesale men will have no trouble in disposing of such stock and will be able to make good returns to the producer instead of being obliged to consign it to the ash barrel and the dump as is frequently done with the poorer quality.

With the retailers it is a pleasure and a satisfaction to handle first class flowers, although they are generally very modest persons, yet with this stock they can stand up and face their customers and demand a price without a blush and they will be sure to get it.

Florists in general are to be congratulated upon the great advances made in the arrangement of cut flowers. The loose natural way of putting them together with their long stems and beautiful foliage with an eye to harmony of color and artistic effect, and the custom of using one or two colors only in each design, is a long step in the right direction, and a vast improvement over the style of a few years ago, where match sticks, corn-broom, toothpicks and wire were supposed to be indispensable factors in making up designs, and an endless variety of flowers of colors were packed stiffly together into what was wrongly called artistic work.

A successful florist always keeps his eyes open and is on the lookout for any new and rare things in his line coming on the market, not waiting two or three years and allowing his competitors to get ahead of him. He tries to avoid everything that will draw his attention from his business, for his soul is in it. Above all he will avoid all small, mean jealousies and endeavor to live on friendly business relations with his neighbors. Honorable competition is commendable at all times.

This society has done much to do away with senseless jealousies and bad feeling in the trade. The local clubs are doing a good work in the same direction, and those who have not a club in their city or town already should organize one right away. Frequent meetings with your neighbors in a business or in a social way cannot result otherwise than in a mutual benefit.

We should not forget the ladies. I would recommend they be given the opportunity to enter the business. More especially in the retail stores will they be found very useful not only as book-keepers and cashiers, but in waiting on customers and in putting up orders. Their correct taste and their aptitude for recognizing the beautiful in form and color will make their services desirable as artists and designers, where harmony of color is so essential. There are many women to-day throughout the country that are doing a profitable business on their own account and there is room for many more in an occupation which is so appropriate and pleasant and for which they are so admirably fitted in refinement and taste.

I believe we should as a society encourage public exhibitions of plants and flowers. There is no better method of advertising for the trade than by displaying our productions at such exhibitions. It educates the public taste and this creates a demand for our goods. It is a good sign to see the commercial florists waking up to the advantages offered by such means for increasing their business. In the past, horticultural exhibitions have been supported mainly by contributions from private collections, but in recent years much creditable work in this line has

come from the hands of our commercial growers.

As the World's Columbian exhibition is to be held at Chicago in 1893 and the time for preparation is short, it is urgent that we should make some move in the matter if we want to make our influence felt at that great and important event. I believe we should as a society do all in our power to assist and encourage the Directory, and to ensure the completion of a horticultural exhibition such as the world has never seen.

Now that the business of the convention is open, I hope the members will attend every session until its close, as there will be plenty of time between sessions for sight-seeing and entertainments now that we meet but twice each day.

There are many valuable and interesting papers to be read and discussed. Essays which have been prepared with much thought and attention. I hope the members will take part generally, expressing their views and not hesitating to ask questions of the essayists. In that way a great amount of information may be gained. And I hope that if any of the members here have succeeded in developing anything of real merit in methods of growing plants, construction or heating greenhouses or any improvements in any way connected with the business they will be generous enough to make it known, for we are all here to learn and a discussion will be of mutual advantage.

I cannot close without thanking the executive committee, also the secretary, for their support and kind assistance whenever it was desired, they have performed their duties cheerfully and well; also to every member, for wherever I have been on either side of the line I have met with nothing but kindly greetings and the hand of friendship and brotherly love has always been extended to me.

Although we are on what is to most of us foreign soil, yet we find the fraternal ties that bind us together as horticulturists and as florists stronger than any political bonds. The kindness received by your executive committee at the hands of our Toronto brethren last winter is not forgotten, and the hearty words of welcome we have just listened to are a proof to us that we are in the hands of our friends.

Thanks to a merciful Providence the death rate has been light since our last meeting, and let us pray it may long continue that we may all be able to attend many conventions in the future and continue to meet the same old familiar faces and exchange annually our hearty greetings; and may the Society of American Florists long continue to prosper and make itself a power in the interests of floriculture, the material and social advancement and the mental uplifting of the fraternity.

Secretary Stewart's Annual Report.

MR. PRESIDENT AND MEMBERS OF THE SOCIETY OF AMERICAN FLORISTS:

While it is true that no specially new or striking undertaking adorns our past year's history, yet it is gratifying to be able to report that we have been making steady progress as a society, and that much has been accomplished quietly but thoroughly towards the internal building up and solidifying of the organization, so that we now find ourselves financially and numerically stronger than ever before, and well prepared to prosecute our work in new directions.

The net gain in membership has been large, and this in itself is one sure indication of prosperity. The funds in the treasury have been steadily accumulating, and competent committees have been at work perfecting plans whereby this very necessary part of our equipment may be still farther strengthened and increased.

The two lesser societies which have been fostered within our organization, the Florists' Hail Association of America and the Florists' Protective Association, are both prosperous and self-supporting. It seemed to the executive committee that the request of these associations for more time and facilities for their annual meetings than has been allotted to them in the past should be granted, and therefore one of our regular sessions—that of Wednesday evening—has been dropped, and the time given up to these bodies.

The most important undertaking now on our hands is the work of the committee on nomenclature. Comparatively few members of the Society have any idea of the great responsibility entailed upon this committee or the vast amount of faithful and earnest work which has been so conscientiously done by the chairman, Mr. Wm. Falconer, to whom this society is under lasting obligations.

Many of the state vice presidents have shown a commendable readiness to do what they could to advance the society's welfare. There are some of these state vice presidents, however, every year, who are not inclined to do any work whatever in the interest of the society. The remedy lies with the state delegations, who should be careful to elect for the office of vice president only those who can be depended upon to represent their state creditably. The number of members who paid assessments for the year 1889 was 827; for 1890, 926. The number of lapses in 1889 from the membership of 1888 was 282. The lapses in 1890 from the membership of 1889 were only 142.

From January 1, 1891, up to August 10 there have been added to the roll 62 new names. The number of new members during that period is considerably in excess of former years. A most interesting fact in this connection is the widely extended territory from which the accessions have come. There was one each from Indiana, Michigan, Ohio, Texas, Virginia, West Virginia and District of Columbia. Two each from Alabama, California and Connecticut. Three each from Kentucky and Wisconsin, twelve from Pennsylvania and thirteen each from New York and Massachusetts.

As these new members have come in without any unusual solicitation, we cannot but interpret the signs as indicating that we are making good headway as a national institution. Just now we are harvesting in a field which has been hitherto scarcely touched, and no doubt the accessions to our ranks from Canada will be large.

The report of the Boston meeting contained 140 pages. Copies were mailed to all members entitled to receive the same; also gratuitously to most of the leading horticultural journals in this country and abroad, and to various horticultural societies and florists' clubs.

The executive committee held its regular midwinter meeting at Toronto. Besides the work of preparing a programme and attending to other details connected with this convention, there were many matters of vital interest discussed, reports and suggestions regarding which will be presented here in due time.

Each year seems to add to the difficulties encountered in obtaining satisfactory rates of fare on the railroad. The rules of certain passenger committees, which were already over stringent, have this year been doubled in severity. However, as we get fully as good if not better terms than other bodies of similar size, it is not probable that any agitation of the matter would be of benefit to us.

The only death reported during the year was one, a phenomenally low death rate for a society as large as ours. Fred Schlegel, of Rochester, N. Y., died on May 15, 1891. He had been state vice president for Western New York in 1889.

In conclusion your secretary takes this opportunity to acknowledge gratefully his obligation to the officers of the society and the members in general for their kind support and willing assistance during the year that is past.

Toronto, Ont., Aug. 18, 1891.

Review of New Plants.

BY WM. FALCONER.

[*Presented at the Toronto Convention of the Society of American Florists.*]

NEW ROSES.—BY MR. ERNST ASMUS, W. HOBOKEN, N. J.

I tried some of the new French roses last winter, and, as usual, found most of them worthless. The French raisers send out glowing descriptions of their new roses every fall, and somehow or other always succeed in luring us to take their bait. Yes, we bite and repent, and almost invariably declare it will be the last time! But the very next fall we take the bait again.

Out of nine varieties of teas I found only one that was worth retaining for another year's trial. Here are the names of the ones I found to be no good: Souvenir de Clairvaux, Comtesse de Witzthum, Comtesse Eva de Starenburg, Jaune Nabonnand, Maurice Bauvier, Princesse Sarsina, Souv. de Lady Ashburton and Souv. de Mme. Sablayrolles (?). Eliza Fugier, a white flower somewhat resembling Niphetos, but stiffer stemmed was the only one I kept to try again.

Among the hybrid teas sent out I imported four kinds, and have concluded to try three of them for another year. These are Mme. Carolina Testaut, a large pink rose, of good, firm petals and stiff stem, but rather too single; Triomphe de Pernet Pere, a sweet red rose, but with too much purple in it for a good cut flower; it is in the form of a Jacqueminot, and would have been a good rose did it have a better color, and Marquise de Salisbury, which, if it were of larger size, would have made an elegant rose. It is a free bloomer, and its flowers are brilliant velvety red, but entirely too small.

NEW ROSES.—BY THE DINGEE & CONARD COMPANY.

Etoile de Lyon is showing up well in the open ground. This beautiful tea succeeds better outside than under glass.

Mme. Agatha Nabonnand is one of the finest bedding roses and a good grower; color, flesh-tinted rose; buds large and fine.

Duchess Marie Salviate is a beautiful new tea rose and a free grower and bloomer; color orange yellow, showing red.

Mme Pierre Guillot is probably the finest of the new teas, and is now blooming fine with us in the open ground. The color of its flowers is richer than Mme. Watteville.

Snowflake and Lady Lambert.—Wish some one would tell us the difference between them.

Mrs. Degraw and Henri Plantier.—Wish also someone would tell us the dif-

ference between these. (As regards Mrs. Degraw: Mr. Wm. Burgess, formerly of Glen Cove, L. I., and now of Brooklyn, and well known as of Marechal Niel fame, told me that he raised this rose from seed perhaps thirty years ago, and named it in compliment to an ex-president of the New York Hort. Society. Anyway, this rose has been grown in quantity about Glen Cove for twenty years or more, and generally known as Mrs. Degraw or the Burgess rose, and as such Mr. Burgess exhibited it year after year for many years at the Queen's Co., N. Y., agricultural fairs at Mineola. And many rosarians, John N. May among them, who have seen the rose here and to whom I sent plants of it, assured me that it was quite distinct from any other rose. Notwithstanding all this, however, I claim nothing regarding its distinctness. WM. FALCONER.)

NEW ROSES.—MR. J. C. VAUGHAN, CHICAGO, REPORTS:

White La France (*Mdlle. Augustine Guinoiseau*) H. T.—A sport from La France and similar to it except in color, which is white, faintly flushed with pale pink. In masses or bunches the flowers are admired by everyone.

Kaiser Frederick, T —Gloire de Dijon type, producing freely large, very double flowers, with the same coloring as in Malmaison. We consider this a decided break in climbing teas, the yellowish salmon tinge common to this type being entirely eliminated.

Climbing Perle and Climbing Niphetos, both genuine climbers, throw up strong, vigorous shoots eight to ten feet in length. The Gulf and Pacific states will plant these roses by the thousand in time.

Madelaine d'Aoust, Tea.—Coppery yellow, petals heavily edged with white; buds medium size; moderate grower; excellent bedding rose; distinct.

Mme. Pierre Guillot, Tea.—Creamy white, petals edged with rose, buds large and of beautiful style. Compared with Mme. de Watteville, color is similar; buds twice as large, more double; every shoot bears a bud, and has not the Watteville habit of throwing blind wood.

Clotilde Soupert, Polyantha Tea.—One of the most valuable roses of recent introduction. It has endured 10° below zero planted in the open ground. Excellent for sale as a pot plant.

VERY NEW ROSES.

Waban.—A sport from Catherine Mermet. Flowers a very deep shade of rose, with a decided glint of red on the outer petals; in an even temperature of 55° to 58° it produces fine buds; young growths and foliage darker than in the parent, but otherwise it is exactly similar. Our experience with it is limited to the growth and behavior of ten 4-inch pot plants, bedded out in January last.

In new European sorts our experience is limited to a few months' growth under glass. There seems to be some good roses among them.

Mme. Elie Lambert may be described as a medium sized Marie Guillot, pure white with an edge of rose on the inner petals, very double, free blooming and a good grower; distinct.

Elisa Fugier.—Style of bud and color very similar to Niphetos. Every shoot produces a bud; growth very vigorous, much more so than in Niphetos. We advise a trial of this for forcing.

Henri Brichard, H. Tea.—Produces very large, globular buds, in color similar to Captain Christy, with perhaps a deeper center; appears to be thoroughly distinct, quite different from any in this section, good grower and free bloomer.

Triumph de Pernet Pere, H. T.—Claimed to be a cross between General Jacqueminot, H. P., and tea rose Desire; buds of fair size, style of Jacqueminot, fragrant, color cherry red, constant bloomer, good, vigorous grower. We are watching this with considerable interest and advise a trial soon as plants are offered.

ROSE NOVELTIES.—BY MR. E. G. HILL, RICHMOND, IND.

Mme. Pierre Guillot, Tea.—A magnificent and distinct new rose, equally good for forcing or for open ground bedding. This rose will rank with the finest of the teas.

J. B. Varrone, Tea.—This variety may be classed as intermediate between Countess La Barthe and the variety Luciole. It combines the free flowering qualities of the former with the rich coloring of the latter. A most distinct and valuable new rose.

Miss Marston, Tea.—A large, open shaped flower when fully developed, of the general build and style of Mermet. A promising new rose. Will probably force well.

Mme. Marthe du Bourg, Tea.—A distinct shaped bud of considerable length, somewhat after the style of Niphetos in form, but differing in color and texture. This rose blooms well, forces readily, and is of good, sturdy habit

Other new varieties of the tea section may be mentioned briefly: Souv. de Dr. Passot, of very brilliant color, but too thin and scanty in petals, and not large enough. Souv. F. Gaulain, a fine, strong, free flowering rose, quite double and of good build, but with decided purplish cast.

Jeanne Guillaumez.—Of beautiful apricot color, but scarcely large enough in bud; very showy when fully blown, and quite free.

Gustave Nadaud —A long-pointed bud of bright carmine color, shaded with yellow, lacking in substance, however, and also in distinctness from other varieties.

May Rivers and Mme. Olga are both very similar to the old variety Ophelia, and not distinct enough from Cornelia Cook.

Georges Farber, Mlle. G. Godard, Mme. A. Tarle, Mlle. M. Fabisch, Mlle. M. Thezillat and Marquis de Foretan are novelties that should not have been put on the market, as they are of no value to anyone.

Augustine Guinnoisseau —"White La France" (H. T.)—This variety is admired by many and condemned by not a few as lacking in distinctness of color; it is not white, but it is quite distinct from both Duchess of Albany and La France. In every respect but color it is a veritable La France, and worthy of culture.

Bona Weillshott, H. T.—Of good growth and great freedom of bloom, but it is lacking both in color and form; occasionally it is quite fine, but so few good blooms are produced that it cannot be recommended.

La France of '89 is a most distinct and fine rose. It, however, is not "perpetual" in its bloom, like the hybrid teas, but is semi-climbing in habit, and of vigorous constitution. It promises well in form, size, and rich coloring.

Mme. Hortense Montefiore, H. T.—Weak in growth, flower lacking in size, generally undesirable.

Mme. Zea Collogne, H. T.—Of the La France type, with a more distinct combination of colors than in most others of this type.

HYBRID PERPETUALS.

Gustave Piganeau.—A most distinct and valuable H. P. on account of its fine form, large size and good color. These points, together with its great freedom of bloom, place it among the finest of its class.

Gloire de Ex. Bruxelles.—A very dark crimson-maroon colored rose with scarlet shadings. Very full and double and free and fine in habit.

Oscar II. Roi de Suede —A very pronounced and distinct H. P. Color cinnabre crimson, with maroon shadings; of strong growth and bearing large, handsome flowers.

Lady Arthur Hill, James Brownlow, Martin Cahuzac and Maurice Vilmorin are roses of promise in the H. P. section, and can be commended for trial.

The above hybrids are the most noted ones out of the many sent out last year, but the judging has all been done from blooms produced under glass.

Pink Rover.—A Bourbon of the general type and color of Malmaison, but somewhat darker in its shadings. This will doubtless prove a useful variety.

Geraniums.

NEW GERANIUMS.—BY MR. E. G. HILL, RICHMOND, IND.

Beaute Poitevine (Bruant race.)—A charming dwarf-growing geranium with immense semi double salmon flowers. A valuable introduction.

Mrs. E. G. Hill (Bruant race)—Somewhat similar to the above in general character, but of a different and distinct shade of salmon; very sturdy and dwarf. A variety of decided merit.

Copernic.—Has round single florets of that peculiar shade of color found in Poete Nationale. Unsurpassed as a market pot variety.

Montesquieu.—Beautiful lavender pink; very dwarf in growth, throwing large bold trusses of perfectly formed double florets. A decided advance in this line of color.

Jeanne d' Arc.—A fine fancy variety of the Souvenir de Mirande type from which it was seeded. It is creamy white with rosy scarlet border on each petal. A fine acquisition. (Mr. J. C. Vaughan also has a very good word for this geranium.—W. F.)

M. V. Noulens.—Another of the Mirande type and quite the largest, finest and best colored in the section. It is of value to all who need a first-class pot variety.

Beauty of Kent —Perhaps the largest circular shaped flower in the family; the color, texture and veining, combined with its dwarf habit and nicely zoned foliage, make it a pattern single variety.

Jacques Callot is slightly larger than Mirande, but is not sufficiently distinct to warrant its continuance on the lists.

Buffalo Bill —Produces immense spherical trusses of semi-double flowers; color, white shaded blush. A good bedding variety.

IVY GERANIUMS.

Souv. Chas. Turner is larger and brighter in color than the grand old variety Count H. de Choiseul. This is a novelty of exceptional merit and every way worthy of extended culture.

Mme. Crozy is quite remarkable as showing so plainly the cross between the Ivy and Zonal families. The flower is semi-double, quite large and very intense scarlet, and the leaf has the form and color of the Zonals and the texture of the Ivies. Destined to be very useful.

LILIUM AURATUM WITH 113 FLOWERS AND BUDS. [SEE PAGE 46.]

NEW GERANIUMS.—BY MR. A. P. SIMMONS, GENEVA, OHIO.

These are some of the new varieties which have been thoroughly tested by us, and we have only mentioned such varieties as have proved meritorious and worthy of a place among the good new plants. You need not have any fear to recommend any of the varieties mentioned.

BRUANT TYPE.

Md. Mulnard.—Soft red, veined darker, with white center, raised by Delesale.

Md. Massage de Louvrex.—Raised by Bruant. Beautiful salmon, flesh-color, semi-double.

Md. du Luc.—Clear rose color with upper petals marked pure white. The best rose colored variety of the type. Raised by Bruant.

Mrs. A. Blanc.—Very large trusses; color, apricot, veined red.

Mon. Louis Fages—Semi-double—clear orange scarlet; habit of plant the same as the well known variety "Heteranthe." An excellent bedder.

Milte Strub.—An excellent variety, raised by Hoste. Soft salmon, with rose border.

GERANIUMS.—DOUBLE.

Montesquieu—One of the most beautiful new varieties sent out for some time; immense sized trusses of beautiful rosy mauve, shaded lilac.

Buffalo Bill.—Very large trusses; creamy white, marbled with rose.

Wilhelm Pfitzer—Very bright, apricot color. The very best of the color ever sent out.

Ruy Blas—One of the grandest varieties ever raised; trusses of remarkable size; a very bright salmon, with peach-colored border. This variety reflects great credit on Mon. Lemoine, the originator. The above four varieties have been introduced by Lemoine.

Md. Ayme de La Chevreliere—An excellent pure white variety, from Mon. Bruant. By far the best white for pot culture, and also a very good bedding variety.

Md. S Deseglisse—Clear rose, marked white, extra fine.

Gloire de Lille—Semi-double, currant red, shaded vermillion, with white eye; very free flowering.

Josephine Gerbeaux.—The best new variety, sent out last year by Mr. Gerbeaux; trusses of immense size; plant of very free flowering habit; color entirely distinct, center of flowers cherry, shading to rosy lilac at the borders.

Dr. Audiguier—Very large trusses, salmon, with bronze shadings; good bedder.

Dr. Guyon—Very soft rose, tinted violet, with white center.

Josephine Soulary.—Sandal, or deep red. Raised by Hoste.

Marquis Felix d' Albert—An excellent variety, on the style of the good old variety, Peter Henderson.

GERANIUMS.—SINGLE.

Copernic.—Rose and carmine, with white center.

M. Poirier.—Carmine and violet color; very large trusses. An extra fine winter flowering variety.

Athlete.—The finest single scarlet variety ever offered.

Admiration—Pure white, with rose colored center.

Md. La Bayle.—Pure rose.

Comtesse de Cornulier—Large pure white border; center rose.

Md. Le Gras Lacaille—The very best of the yellowish orange colored varieties.

Panache de Nancy.—Salmon, nicely striped with pure white. Good for pot culture.

Jeanne d' Arc.—A new variety, of the Souv. de Mirande type, being darker and brighter in color. This is the best of the type and will be sent out in this country this coming season.

Fuchsias.

NEW FUCHSIAS.—BY MR. A. P. SIMMONS.

Molesworth—Very free blanching double-white variety, from England; of the style of "Storm King," but stronger grower.

Abbe Garnier—The best double purple variety we have seen, having very large flowers and being early and free flowering. Color, violet blue with rose markings.

Jupiter.—Violet blue, large, fine formed flowers, extra fine.

Countess of Aberdeen.—Described by Mr. E. G. Hill.

Ernest Renan—Very early single variety; tube and sepals white, corolla rose color.

Gem of Lavington—Sepals white, corolla single, carmine tinted violet; early and free.

NEW FUCHSIAS.—BY MR. E. G. HILL.

Out of a multitude of new varieties only a very few possess points of merit sufficient to give them a place with Phenomenal and Mrs. E. G. Hill.

Countess of Aberdeen is worthy of notice on account of its approaching so near a pure white in color. When grown in shade both sepals and corolla are absolutely pure white, but in sunshine it "pinks" slightly. This is a fine novelty and will probably prove the forerunner of a race of distinct colored fuchsias.

Ulysee Trellat has a somewhat conical corolla, large and pure white beautifully shaded rose; sepals deep crimson. Of nice habit and very free flowering; an excellent variety.

I have selected only the very finest of the introductions of last year and would say that there are novelties that possess many other points of merit that must recommend them for certain purposes while there are large numbers of others which should never have been introduced, because they are inferior to existing sorts.

NEW PANSIES.—BY MR. DENYS ZIRNGIEBEL, OF NEEDHAM, MASS.

There are the good old English and Scotch strains that the German seedsmen and florists have got hold of and sub-

divided into ever so many colors and varieties, but they practically remain the same thing and I do not see that any improvement has been made in them except in the catalogues by rechristening them.

A really new strain is the Trimardeaux, originated by a florist near Paris, France, but it has been greatly improved since then. These pansies are very large in all their proportions, flowers and foliage, and, too, very hardy, standing well both extremes of heat and cold, and they give general satisfaction all over the country.

Another new strain, also of French origin, is the Odier or five-spotted varieties which of late years have been greatly improved on by the well-known specialists, Cassier and Bugnot, the latter especially introducing new shades of color, and flowers which would have been thought impossible a few years ago. These last strains, however, are by no means as hardy as other strains, owing, I suppose, to closer breeding.

These two races are the only really new varieties that have been introduced within the past few years, and that are, in my opinion, of any merit, and I have come to this conclusion after having tried, within the past five years, every thing of note in the pansy line.

AZALEAS FOR FORCING.—BY MR. JAMES DEAN, BAY RIDGE, L. I., N. Y.

The best of the azaleas that I have imported within the past two years are:

Azalea Vervaeneana.—A magnificent, large, double flower of a rich rosy pink color, broadly margined with white, and a carmine blotch. It is very distinct and free-flowering and it forces well; indeed, it is one of the best azaleas in cultivation to-day.

Azalea Imperatrice Victoria.—A splendid variety, and perhaps the most beautiful of all the double flowering azaleas; flowers of a most beautiful shade of rosy pink banded with pure white. The plant requires careful attention during the hot summer months or the foliage will get brown and drop.

Azalea Madame Louis Vervaene.—A most distinct variety; flowers pure white, striped and spotted carnation-like with rosy incarnate. A first-class azalea.

Azalea Triumphe de Mont St. Amand.—A fine azalea with very large double flowers of a clear rose color with pure white ribbon; bright carmine spot on upper segment.

The best of the older varieties of azaleas are Madame Vandercruysen, Simon Mardner, Empress of India, Emperor of Brazil, Bernard Andrea alba, Sacountala (if Easter is late), and Deutsche Perle (if Easter is early.)

Begonias.

NEW BEGONIAS.—BY MR. JOHN SAUL, WASHINGTON, D. C.

Begonia Triumphe de Lemoine and B. President Carnot are two fine begonias, which I hope will bed out with us in the Middle and Southern States. The ordinary types of tuberous-rooted begonias will not succeed bedded out in this latitude or South. I can only grow them in cold pits shaded with slats. Begonia Baumani is a new species and comes to us highly recommended, but we have to grow it a year or two to test its value.

NEW BEGONIAS.—BY MR. J. N. GERARD, ELIZABETH, N. J.

Begonia Vernon, (Semperflorens atropurpurea), is promising, but needs further trial. If the leaves hold their color out of doors it will be a good bedder.

Begonia Metallica Variegata.—Has creamy white and pink markings; attractive, but less vigorous than parent.

BEGONIAS.—BY MR. F. T. MCFADDEN, CINCINNATI.

Among the new hybrid autumn and winter flowering begonias I particularly recommend Veitch's Adonis and Veitch's John Heal. The former was obtained by fertilizing one of the summer flowering tuberous begonias with the pollen of begonia John Heal and John Heal was obtained by fertilizing Begonia socotrana with the pollen of a seedling of the tuberous section. The habit of Adonis is robust, erect and furnished with bold foliage. The panicles are many, standing well above the foliage, graceful, drooping, bearing flowers three inches in diameter, bright rosy carmine, toned with scarlet. They appear in November, and continue long in perfection. In the case of John Heal, the leaves are smaller, and the flowers are produced in long racemes of six to nine on nodding scapes. They are one and a half to two inches in diameter, rose carmine, continuing fresh fully three weeks.

NEW BEGONIAS.—BY MR. E. G. HILL.

Louise Closson.—This variety is the most highly colored of all the Rex section, being as decided an advance upon Lucy Closson as that variety was upon the popular Louis Chretien. The zone is a bright rosy purple of wonderful lustre.

Marquis Peralta is destined to become one of the most widely grown of all the Rex section from the fact of its refined beauty and its remarkable freedom of growth and luxuriant foliage.

Bettina Rothschild is after the style of the much admired Fire King, but is a great improvement in habit and freedom of growth; the young foliage is bright velvety red, heavily piled.

Among the flowering begonias nothing is finer than Paul Bruant, which is a special wonder both in quantity and continuance of bloom, while the habit is beyond criticism.

Tri. de Lemoine is a near approach to the above in quantity of bloom and promises to prove a good bedder.

Pres. Carnot is an advance on Rubra, both in size of leaf and bloom, and also promises to make a fine bedder.

NEW BEGONIA.—BY HENRY A. DREER, PHILADELPHIA.

Begonia Eclipse.—Not yet disseminated. A sport from Countess Louise Erdody, possessing the same peculiar spiral or shell-like leaf appearance as its parent, but is distinct from it in the color and marking of its leaves; ground color, deep, lustrous green, with deep, bronzy metallic center and edge.

BEGONIAS.—BY PITCHER & MANDA.

Begonia Arthur Malet.—Leaves dark green, covered with fine dots of crushed strawberry color, with metallic lustre; red hairs on surface of leaves; young leaves red.

BULBOUS PLANTS.—BY E. V. HALLOCK, QUEENS, N. Y.

Amaryllises are gaining favor. Meriden, Tendresse and Williamsii are fine sorts.

Anomatheca Cruenta, known in the trade as "scarlet freesia," from the Cape of Good Hope, has sprays of scarlet flowers. Starts slower and blooms later than freesia.

Brodiaeas are Californian bulbs, quite popular with amateurs. With a winter mulching they are hardy here.

Calochortuses are decidedly good for dealer and consumer. Easy to grow, easy to flower, and blooms well indoors or outside; beautiful and lasting. I think C. Gunnisoni is the best of all of them.

Chionodoxa Lucilia is very beautiful and has become a standard bulb. C. Sardensis is newer, smaller, and of a darker blue color.

Crinum Kirkii, from Zanzibar. Bulb, plant, spike and truss of flowers very large. Should be grown in the South until the bulbs reach a large size.

Richardia Æthiopica, var. compacta, known as the dwarf calla. Is dwarfer and more floriferous than the type, and, too, the flowers are smaller, but of fine shape.

Zephyranthes Andersoni, known in the trade as Habranthus. Is yellow flowered and a fine companion plant to the pink and white flowered species. Easy to grow and keeps well.

Gloxinias.—The French tigered and spotted and some other good strains come true from seed. Defiance, scarlet, and Emperor Frederick, azure blue with white throat, are both fine varieties that come true from seed.

Tigridia violacea and T. Patscuaro (?) are new this year. T. buccifera has small, purple flowers, but they last only a short time and the plant soon runs to seed; these should be cut off, however. T. Pringlei is a fine species of the pavonica type, but I have found various shades of color in it. Rather a good bulb; grows very compact.

Montbretias have thoroughly established themselves in the public's favor, and, too, in the dealer's pocket. They possess all the advantages of a gladiolus—they are easy to keep, grow and bloom, and the blossoms are beautiful on the plant or cut. Some kinds have distinct bulbous roots, others more fibrous—don't bother with the latter; and some have a better habit than others. The very best sorts are Crocosmiaeflora, Pluie d'Or, Transcendent, Soleil Conchant and Elegans.

Irises.—Among Kæmpfer's irises, Alexander, Malmaison, Gold Bound, Beth Hallock and Blue Danube are very fine.

Iris Iberica, although an old plant, is a good one, but scarce. I. reticulata, a bulbous, early, sweet kind, has always been high priced, but it is coming down.

Gladioli.—Creole and U. S. Grant, of Dingee & Conard, and Miss Dudley and Nydia, of Burpee, and Florence Vaughan are exceedingly fine new varieties of American origin. Lemoine's new strain of Nanceianus is typical of the parents. In Harry Veitch the individual flowers are distinct and good, but set very bad on the spike; the same is the case in Dr. H. P. Walcott and Carnot. In other instances the spike is finely furnished, but the flowers lack color and form. New Blue has not brought much *blue* with it, except to the one who paid $2 for it. The color is bluish violet, or purplish blue, and quite deep, and the flower is small and shaded, like purpurio-auratus. But much to my surprise the variety is a good grower. Speaking of blue flowered gladioluses: We ourselves have had many, from deep in color to white stained with clear blue; in some the bulbs are even blue. But all are poor growers. Of ten varieties of these we have, five have not yet started to grow this year, although the bulbs are apparently in good order and healthy. To get up a stock of blue gladioli is hard work and no "kodak" process, and this is what surprises me in the New Blue; it is a good

THE SHEPHERD'S CROOK. [SEE PAGE 48.]

grower. Louis Van Houtte, both in Nanceianus and Gandavensis is so poor as to have no excuse to exist in either section. And I would ask our Gallic friends, why put out eight to fourteen new varieties a year when there is real merit in only two or three?

Lilies.—In lilies there is Lilium ochroleucum, soft, yellow, trumpet shaped, from India. L. Grayi, from Roan Mt., not unlike a crimson L. Canadense, but the flowers are not reflexed. There is also a small form of L. Washingtonianum on the market, and said to possess merit. I don't mean rubescens. L. auratum macranthum is very fine. And L. speciosum var. Opal will soon be on hand. It is a good one. (I have had an eye on this new variety called Opal for several years, and seen it in all its stages of growth, rest, multiplication and bloom, and unhesitatingly pronounce it one of the grandest acquisitions we ever have had in the way of hardy lilies. The plant is healthy, and an excellent grower and free blooming; the flowers are white, spotted —stained with pink. A most lovely lily. WM. FALCONER.)

Dahlias.—A. D. Livoni is the best of all pinks. Triumphe de Solforino, a very marked bush form, with large, intense solforino flowers; Margaret Bruant, the best dwarf white, on camelliæflora order; Lucy Fawcett, a show variety, early and exceedingly free; Electric, cactus order, brilliant scarlet, very free; White Dove, long stems, toothed petals; Harry Freeman, cactus order, an improvement on Henry Patrick; Crimson Beauty, a remarkable pompone, and Robert Maher, the best yellow cactus dahlia.

Herbaceous Phloxes.—The new ones are wonders, single florets in many cases cover a silver dollar. Aurore Boreale, Eclaireau, Panama, Paul Bert, Le Soleil, Steudhal and Flambeau are fine. The foliage of Golden Bedder is of a good yellow color.

Chrysanthemums.

CHRYSANTHEMUMS.—MR. EDWIN LONSDALE, SECRETARY OF THE NATIONAL CHRYSANTHEMUM SOCIETY, SENDS ME THIS:

The following are the best new chrysanthemums which came under my notice last November, and I believe were distributed for the first time this year.

Louis Bœhmer, (P. Henderson & Co., imported). Light purple, hairy like Mrs. Alpheus Hardy. Plant very vigorous.

Mermaid, (Dorner). Delicate pink. Very good

Frank Thompson, (not Mrs. Frank Thompson), (Jamison). White, shaded with delicate pink. Vigorous.

Mrs. Isaac D. Sailer, (Harris). Silvery pink. Winner of the "Sailer Prize" at Philadelphia last November.

Mrs. J. D Whilldin, (Harris). Light yellow. Winner of the "Whilldin Prize" at Philadelphia.

Eldorado, (Monahan). Deep yellow; incurved broad petals.

Mrs D. D. L. Farson, (sent out by Spaulding). Rich silvery pink.

John Firth, (Spaulding). Soft pink.

Lily Bates, (Spaulding). Bright pink.

Anna M Weybrecht, (E. A. Wood). Pure White; Chinese form.

Target, (Surman). Bright crimson, similar to Cullingfordii or Tokio. Exhibited in Philadelphia under the name of Shenandoah.

Yonitza, (N. Smith & Son). White; Chinese; distinct.

Mrs. H. A. Pennock, (Harris). Might be described as a yellow Violet Rose.

Beacon, (Fewkes). Creamy white; an improvement on Mrs. Langtry. Winner of silver medal at Boston.

Waban, (Fewkes). Pink. A very much improved Robert Crawford Jr.

Mrs. John Westcott, (Harris). Creamy white, shaded with delicate pink; very large.

Flora Hill, (sent out by E. G. Hill & Co.) White. Extra fine variety.

Mrs E W. Wood, (Wood). Rich dark purple. Very distinct.

James H. Freeland (Wood). Blush; petals broad; flower large. Beautiful.

Pitcher & Manda name Dr. Chas. Brigham, white; John Dyer, chrome yellow; W. W. Lunt, lemon yellow; Rohallion, chrome yellow; John Lane, pink tipped with yellow; Etoile de Lyon, white; Harry E. Widener, yellow; Shasta, white, and Mrs. Grace Hill, blush. But most of these have been in the trade for a year or more.

SOME HARDY PLANTS.—BY EDWARD GILLET, SOUTHWICK, MASS.

Arenaria Grœnlandica.—A little alpine, easily grown from seed, forming small tufts of fine narrow leaves and large flowers.

Clematis Fremontii.—A low-growing herbaceous species with light purple flowers, perfectly hardy and adapts itself to any garden soil.

Cooperia pedunculata and *C. Drummondii.*—Fine bulbous plants from Texas. The flowers are white and pink. Pedunculata blooms earliest in the season and has larger and more numerous blossoms than Drummondii.

Erythronium albidum var. coloratum.—A bulbous plant from Texas. Has large white, sometimes pink flowers; a thrifty grower, great bloomer and quite hardy.

Shortia galacifolia—Its beauty is much over-rated, and it is not an easy plant to establish. The interest attached to its re-discovery after having been lost for a hundred years has made it famous.

Galax aphylla is, in my opinion, a finer plant. Its flowers are not showy, but it has such beautiful leaves, from dark green to bright crimson, and it can be grown in shade or sunshine, in dry or wet soil.

Trillium stylosum has beautiful white or pink flowers, and is very easy to grow.

Calochortus flavus comes to us from Mexico and is a beauty. The outer leaves of the flower are dark mahogany color, and not quite as open as are those of Cyclobothra flava.

Lilium Grygi.—Like L. Canadense, but the flowers are darker in color.

Nemastylis Pringlei and *N. Brunnea* are both new bulbous plants, but tender.

Tigridia buccifera has blue flowers. Tigridia Pringlei has scarlet blossoms. Both are tender and should be cultivated exactly like the older tigridias of our gardens.

Azalea calendulacea, our native flame colored species, is one of the loveliest shrubs of this continent and thrives admirably in cultivation; indeed, it is as well worth growing as any of its hybrid progeny, called Ghent Azaleas.

Hydrangea radiata is another much over-looked native shrub we should grow more of for the sake of its striking handsome foliage—deep green above and cottony paper-white below.

SOME HARDY PERENNIALS.—BY MR. GEO. W. WOOLSON, SUP'T OF GARDENING, NEW YORK CITY PARKS.

Aquilegia cærulea var. alba—This is what the seedsmen in Europe have been sending out as A. chrysantha alba. I had it from Utah some ten years ago. It is entirely distinct from chrysantha which I have never seen make any break towards a white form. (I have grown A. cærulea alba for years; it is the most elegant and beautiful white columbine known. The variety above referred to as A. chrysantha alba, so far as my experience with it extends, is not as good as cærulea alba. At first I thought it belonged to cærulea because of a bluish tinge in the white, but as the strain is not yet quite fixed, every plant has either white or yellow flowers and among scores of plants not one had blue flowers. This leads me to think that chrysantha blood is here, but not pure, because of the lesser stature and earlier blooming properties of the "new" variety. But as we all know, A. cærulea, A. chrysantha and A. truncata, in gardens have been thoroughly mixed together and given rise to an interminable assortment of so-called "Hybrids." W. FALCONER.)

Coreopsis grandiflora is commonly sent out under the name of C. lanceolata. Flowers, orange yellow. In bloom from early summer till fall. About 2 feet.

Centaurea macrocephala.—Flowers in head, 2 inches in diameter; bright yellow; June; 2 feet.

Leuzea conifera.—Flowers in cone-like bunches in June, purple; foliage whitish, pinnatifid; 12–18 inches.

Hypericum Buckleyi—A dwarf species with numerous half-inch wide yellow flowers in June; also has handsome leaves.

Echinacea angustifolia var. alba—Plant 2 to 3 feet, flowers white, 2 inches across and appearing all summer.

Pentstemon decumbens—A dwarf, spreading half-shrubby plant with spikes of deep purple flowers in summer.

Psoralea subacaulis.—A tuberous-rooted species with clover-like heads of purple flowers in June.

Geum Pyrenaicum.—Has bright yellow flowers in June; 12 inches high.

Potentilla Thurberi.—Flowers, deep red, numerous in July and August; plant 18 to 24 inches.

Serratula Tartarica—Has yellowish scabios-like flowers all summer; plant 4 to 5 feet.

Liatris pycnostachya var. alba—A fine white variety of the purple Kansas Gay Feather.

Echinosponnum macranthum—A thistle-like plant, 4–5 feet high, with round heads of light purple flowers all summer.

Echinops communtatus—Has reddish purple flowers in 2-inch heads in July and August; plant 2–3 feet.

Schœnolirion croceum—A tuberous-rooted plant, 12 to 18 inches high, with spikes of small yellow flowers in June.

Zizyophora chenopodioides.—Flowers purple, in spikes; the whole plant strongly scented.

Brachychæta cordata.—Similar to a golden rod; 18 to 24 inches high; flowers bright yellow in August and September.

Rhododendron Indicum var. obtusum came to us from Japan as Azalea amœna from which, however, it is very distinct; it has brilliant red flowers, and is an evergreen, hardy and most desirable little shrub. [CONTINUED NEXT WEEK]

OBITUARY.

GEORGE S. HASKELL.

From Rockford papers we extract the following biography of Mr. Haskell's life. He has made a brave fight in all ways and many friends will mourn the loss of him who has just gone, after meeting most of the trials that this human life is ever called on to endure:

George S. Haskell was a native of Rockford, being born Oct. 4, 1838. He was one of the first persons born in this vicinity. His parents were among the pioneers of this country and his father was a man of ability and prominence. In 1864 Mr. Haskell started the seed business which he subsequently built to such magnitude. He was a young man of 26, full of energy and vigor, and possessed of splendid business qualifications. He made his business a great success. All over this country, even in Europe the firm bore a high reputation as a seed house. Along in the 80's Mr. Haskell became enamored with silver mining and put a considerable sum of money into a mine out west, being associated with several other gentlemen. The mine did not pay and the whole of the Masonic block on West State street, which he once owned, went into that silver mine, it is said.

Mr. Haskell was a very generous, open-hearted man, always at the service of his friends and endorsed notes for an eastern business man who was a warm personal friend. This man failed about two years ago and a lot of his paper came back onto Mr. Haskell to pay. Stripped as he was by his mining speculation, this extra demand on resources swamped him and a failure resulted. It nearly broke his heart and he has never been a well man since. After having made an ample fortune in legitimate business to lose it in such a dismal investment and because he was true to a friend, preyed upon his health and he could not recover himself. He said to the writer at the time of his reverses: "It all came because I was too anxious to get rich fast." Generous always, he blamed not the friend whose notes he had signed and which precipitated his trouble. He bowed before the misfortune, and heroically accepted the blame all on himself.

But he did not sit idly down and pine away. He made a brave effort to re-establish his fortunes, and had his health been spared he would doubtless have succeeded. The seed business was purchased by a stock company composed of men who knew Mr. Haskell and trusted him, and he was put in charge. The past year has, it is said, been a singularly successful one with the business, and the future augured bright, but ever since the catastrophe Mr. Haskell has not been perfectly well and has struggled against ill-health. A few months ago he was in attendance at the state board of agriculture of which he was president when taken very ill suddenly, and since then he has grown steadily worse. His disease was dropsy, and for weeks it has been only a question of time.

In his home the hand of affliction fell most heavily upon him. His only children, two splendid sons, the pride of his life, died in the early years of manhood's estate, just when he was looking forward with keenest anticipations to a bright and promising career of business success and social position for them. George Haskell died in 1879, aged 19; and Mark in 1882, also 19 years old.

Words are feeble expressions at best under the dark shadow of a sorrow like this, but there must come some consolation to the stricken wife and sorrowing relatives to know that no man has ever gone out of this community into the mysterious unknown who bore a greater flood of affection and appreciation or who will be more sincerely mourned. Open-hearted to a fault, outspokenly frank in his opinions, with no pretense of being better than other men, he did the right as he knew the right and was not swerved from his convictions by any influences.

Lilium Auratum.

The accompanying engraving (page 43) is from a photograph sent us by A. Unger, Yokohama, Japan, who writes: "Herewith I send you a photograph showing two spikes of Lilium auratum taken from Louis Boehmer's lily field here. The long one is a normal flower stem with twenty-two flowers and buds, and the smaller one is a monstrosity with 113 flowers and buds. The bulbs of each are about equal in size and were growing in the same field. The stem of the smaller one is flat-like, pressed together, and about three inches broad where the stem is parted. So many flowers on one stem is a great curiosity, though stems with thirty flowers are found. I intend to experiment with this bulb next season and see how many flowers it will bring the next year, and how many those which now have less."

New Carnations.

BY FRED DORNER.

[*Read before the Society of American Florists at the Toronto Convention.*]

The advisability, no, I will term it stronger, the necessity of introducing and the growing of new varieties to take the place of the worn out and exhausted ones, has been demonstrated. There is a wide field of progression and improvement for any florist, whose love for the divine flower will prompt him to spend a little time and labor, in producing new varieties.

I will first call your attention to a fact which cannot be disputed, and ask the question: What has become of the varieties grown ten to fifteen years ago, varieties like Pres. De Graw, La Purite, Edwardsii and many others? I suppose they are cultivated yet, but only in certain localities. And how many of our present varieties are fast degenerating and are no longer profitable? What is the cause, and what remedy shall we apply? We will look into the first, an answer will suggest itself for the second.

I have been told that in Europe—and you will agree with me that it is here the same—they put the life, or rather the paying time to grow a variety, from six to eight years. I believe some of our varieties are even shorter lived. To my mind the cause of the degeneration, lays in the nature of the plant, in its perpetuity of growing and blooming. Although perennial we put the life of an individual plant at one year and grow new plants every season. But propagation is not reproduction, it is only a part from the old plant grown to an individual again. This process gives new life, but by following it up year after year it must degenerate. We may just as well say: We grow the first plant from seed in an endless multiplication of plants from year to year until it dies. Just the same as you grow a plant from seed, give it all the best requirements to grow and bloom, its life will be at the longest two years; propagation only prolongs its life. There is no rest in the nature of the carnation, it still keeps growing even in a low temperature, that will put other plants to rest, while actual frost will kill it. Its sisters, the hardy pink and the hardy carnation so extensively grown in Europe but only for summer blooming, rest through the winter. The ever-blooming carnation would die if subjected to the same treatment. Now for the regeneration of our degenerating varieties, nature tells us to reproduce; and the natural reproduction of all plants is only through the seed. Through this source we also receive our new varieties. We actually get a new born plant with new vitality and fresh vigor. But not only do we get new varieties; here is also the time and place to make improvements. Great predictions are made for our divine flower, and truly much can be accomplished yet. Look at the rose, the chrysanthemum and others; with rapid strides they are moving on. The divine flower will not, and shall not, stay behind. Here is a wide field for enterprising florists, who will not leave everything to chance, but calculate and experiment. They are expensive operations, but seldom losing ones, as I will show farther on with my experiments.

In this work we have to deal with factors in the nature of the carnation, which present many obstacles. And I will say here, if it were not for these difficulties, I believe we would grow all our plants from seed instead of cuttings, and thus double our crops. These difficulties are the tendency to revert back to the original, a single flower of a carnation or flesh color, and the incompleteness of the sexual organs. Like all double flowers, the double carnation is the result of high cultivation, and its doubleness becomes only part nature. Single flowers, I presume, will only bring single blooming plants again, while seed from double flowers will only produce from 40 to 50% double blooming plants; the rest will be single again. As to the incompletenes of the sexual organs, I have found flowers totally destitute of the same, few have only the anthers, while a good many have only the pistils. I never found any pollen on the Silver Spray yet, but have successfully grown seed on it, when fertilized. Many flowers have the anthers but are destitute of pollen. In most flowers, when perfect, the pollen is ripe and gone before any fecundation can take place. So if we want to grow seed we have to employ artificial fertilization. The tendency of breeding back has also a great influence in regard to color. Seed gathered from only white flowers, may produce red and pink, if some of their grand-parents, or still older ancestors were of that color. From a white and pink variety I got scarlet and deep maroon. On the other side, when successful, from Century and Grace Wilder I got excellent pink varieties, improvements on both the parents. So this running out of the line happens, but is not a rule. From 500 plants grown by me in 1889 about 250 were single, 150 bore split and imperfect flowers, some monstrosities measuring six inches in diameter. I selected 100 and grew again last year, and these were thinned out to about 25. This leaves me 5% good new varieties. Varieties with more vigorous growth, blooming more prolific than any of the present older varieties now in cultivation, and a goodly number far ahead of any in every point, not to speak of the new shades which are truly beautiful.

The expense is in growing the seed and growing the young plants to the first blooming, but this is considerably lessened by the out door culture. The seed germinates readily, the young plants grow on fast, and by the time to plant out they are as large as those grown from cuttings, and by the time to house again, most have bloomed and show what they are. True, it is discouraging to throw about 75% away as worthless, but the remaining 25% may repay you well for all your work. I give this as my own experience and think I am not far from an average. The second year's growing, or testing their merits—that is plants grown by cuttings from the seed plant—is very interesting, and what is still better, remunerative. It is a delight to see the luxuriant vigorous growth, the prolific blooming, and what a contrast when grown side by side with the older varieties. Of the 1,000 or more plants, an average of ten of each of the 100 seedlings retained and grown for a second season, beside about 300 new seedling plants, were a sight worth seeing, as some of our brother florists present here, who visited my place last January can testify. I am very sorry I did not keep an accurate record of all flowers cut, but I feel confident that it would out-number any statement made in last winter's controversy in the AMERICAN FLORIST.

But on the other side, you will meet disappointment as well as surprises. Varieties which, judging from the first blooms, I thought the climax of a carnation, subsequently produced flowers far inferior to its first blooms, and others, regarding which I was undecided whether to keep or throw away, came out on top. This shows that no varieties can be considered constant until tested a second season. It has also been plainly demonstrated that carnation culture can be made more remunerative if we supplant our old varieties from time to time with new ones grown from seed.

One variety has a longer life than another; one grows in one locality better than in another. New varieties can be grown and put on the market at a price that will enable every florist who grows carnations to try them, and select what does best with him. Every merchant praises his wares, every grower has the best new varieties. Put them within the reach of all, and the best will surely come to the surface. By the short life a variety may have it is not well to keep it back for higher prices, and then throw it on the market when half its life is spent. And only by this method of reproduction can we make and expect improvements. One should be careful in selecting the parent plants to use only the most perfect material. Strong healthy growth, long stiff stems and the most perfect flowers. Our divine flower, a flower that is in our reach every day in the year, deserves more attention. More interest is already awakened, and I am very much mistaken if we are not nearer Mr. Thorpe's ideal than he thinks himself.

Winter Blooming Plants Suitable for Decoration.

BY W. H. TAPLIN.

[*Read before the Toronto Convention of the Society of American Floris's.*]

This subject is one of much importance to a majority of the members of our society, and it is therefore with some degree of hesitancy that I have attempted its brief consideration, and also from the fact that I have been in some doubt as to the proper limitations of such a paper. The conclusion arrived at, however, is that it would be advisable to divide the subject into three heads. First, plants that bloom naturally during the winter season; second, plants forced into flower during the winter; third, bulbous plants suitable for decorations.

The first section, that of plants whose natural season of flowering falls in the winter, probably comprises the shortest list, for while there are many winter flowering plants, yet all are not adapted for the purpose in view, there being in the opinion of the writer some special qualifications necessary in order to render a plant valuable for this particular use. Some of these qualifications may be briefly stated as follows: Shapely or graceful form, decided color, moderate rapidity of growth, and last, but certainly not least, the quality of being easy to grow under ordinary conditions, for on the latter attribute largely depends the popularity of most plants used for decorating.

Among the plants of the first section the poinsettias deserve a more prominent place than has been accorded them of late years, for where vivid coloring is wanted they meet all requirements, and as the bracts of these plants keep in good condi-

tion for several weeks, there need be but little loss from waste of flowers. The original variety, P. pulcherrima, is perhaps the most satisfactory for all purposes, though the double form of this is also extremely showy, and keeps well, too, providing that water is not allowed to lodge among the bracts. P. pulcherrima major is also pretty, the color being crimson, rather than the scarlet of the type, and either of these, to become useful for decorations, should be stocky, well grown young plants from summer cuttings of soft wood, and which may be made to produce one large head of bloom on a well furnished plant in a 5 or 6-inch pot.

Plumbago rosea coccinea is another brilliantly colored winter flowering plant, the terminal spikes of which are clothed with bright red flowers about one inch in diameter. Of course, this is not by any means new, but may possibly find a more extended opening in the future than it has in the past, being easy to propagate and flowering with the least encouragement.

The cinerarias, too, have been wonderfully improved of late years, and not only in size and color, but also in methods of cultivation, the chief requisites of the latter appearing to be a cool, moist atmosphere and generous treatment in the matter of fertilizers. And in order to keep up a succession of these useful plants it is well to make more than one sowing of the seed, the latter to be of the best strain that can be secured.

Yellow flowers are somewhat scarce among the winter flowering plants (with the exception of chrysanthemums) and an old fashioned though pretty subject of this popular color is Reinwardti trigyna, perhaps more readily recognized under its former name of Linum trigynum, and which may be grown into bushy little plants in 5 or 6-inch pots with very little trouble.

Erica hyemalis, now frequently seen during the season in the larger cities, is probably the most useful of its family for our purpose, being of free growth when given reasonable care, while its long sprays of rosy tinted flowers give an additional charm to many a tasty decoration.

Libonia floribunda still finds a place among useful plants, for although its red and yellow flowers are small they are produced in such profusion as to be quite showy, and the plant is also capable of enduring much neglect without great injury.

It hardly seems necessary to remind the members of this society that chrysanthemums should be included among our decorative plants, this fact being already well proved. And the only suggestion offered in this connection is that none but distinct colors be grown for this purpose, and only sorts enough to insure a proper succession of bloom.

Pot plants of carnations, bouvardias, roses, some of the begonias and eupatoriums and other well known plants will naturally suggest themselves to the decorating florist, and therefore do not call for any extended notice in the present instance.

Primula sinensis in variety comprise a useful group for winter work, not the least important member of this interesting family being the double white variety, and as the single flowered forms found in some good strains vary from white to dark red, and also include all shades from pale lilac to almost blue, there is sufficient range of color to satisfy the most fastidious.

Coming now to our second heading, that of "plants forced into flower" for decorative use, we find a considerable variety to choose from, though largely found among familiar species. Very near to the head of the list, if not fully occupying that enviable position, are many of the splendid varieties now found among the Indian azaleas, the merits of which have often been discussed before. It may be noted, however, that Deutsche Perle, Fielders' White, and Borsig are among the most satisfactory whites, while Mme. Vander Cruyssen, Eugene Mazel, Vervaeneana, and Bernhard Andreas are fully able to sustain the reputation of the colored varieties.

Some of the rhododendrons also will bear further investigation regarding their utility as plants for winter decorations, there being no great difficulty in forcing some of the hardy varieties, while some of the hybrids produced among the East Indian species bloom at almost all seasons. Among the latter there are many notably beautiful varieties, and if they can be reproduced in quantity at a reasonable cost they would doubtless find a ready market.

A large number of hardy shrubs are now included in the forcing list, prominent among which are the lilacs, these being classed with the most popular from two reasons: Their beauty, and the ease with which they may be forced. Pyrus japonica has also proved easy to force into flower, though the flowers so grown are much paler in tint than those naturally produced, and some of the shrubby spiræas are satisfactory under similar treatment, one notable instance being S. Thunbergii, which produces its pure white flowers with as much freedom as does Deutzia gracilis.

The hydrangeas must not be omitted, there having been several handsome varieties added to the list within recent years, though most of these varieties appear more satisfactory toward spring. The method often adopted of growing on summer rooted cuttings of hydrangeas into nice little plants in 4 or 5-inch pots and bearing one head of bloom, gives some useful stuff for winter and spring use.

Has the Crape myrtle (Lagerstræmia indica) been thoroughly tested for winter forcing? If not, it may be worth trying, for either the white or pink variety would be an admirable addition to the stock of decorative plants, providing they are well flowered.

Acacia pubescens (and several other species of the same genus) may be used to supply pale yellow flowers, and the well-known gracefulness of these plants should secure them a place anyway, while Cytisis canariensis and C. racemosus furnish a deeper shade of the same color and are really invaluable for decorating.

Having now arrived at our third heading, "Bulbous plants for winter decorations," one of the first to suggest itself for mention is Cyclamen persicum, a plant that seems to be gradually coming to the front again after some years of comparative neglect.

Of course, cyclamens have been much improved by careful fertilization, and are consequently more valuable now to the florist, and in addition there have been some changes made in methods of cultivation, the most approved now being the system of growing on the plants from the seed to flowering size without any period of rest or drying off process, the whole operation being completed in from fifteen to eighteen months. It should also be remembered that "the best is the cheapest" as regards cyclamen seed, and by starting with a good strain and then carefully selecting some of the best plants for seed bearing it is possible that the stock may be still more improved in future seasons.

Liliums Harrisii and longiflorum should not be forgotten, as with proper handling these may be had in bloom in successive lots all through the winter and spring. Some of the amaryllis also force well and their showy flowers appear to advantage among a mass of foliage plants.

A selection of Dutch bulbs is one of the essentials for the complete equipment of the decorating florist, among the most useful being tulips, daffodils and other narcissi and hyacinths, and one point worthy of remembrance in choosing tulips and hyacinths is to have none but clear, distinct shades, these being naturally the most satisfactory when endeavoring to form a combination of color in a decoration.

In conclusion it will be understood that all the plants here referred to are not claimed to be profitable in all localities, the question of suitableness rather than profit having been the one under consideration, though in a majority of the examples cited the latter point has also been remembered.

The Shepherd's Crook.

The shepherd's crook, seen in the illustration (page 45), is sometimes used with good effect in place of bouquets or baskets for bridesmaids.

The Directoire stick is much the same style, with the exception that instead of a crook on the end it has a knob. Such sticks are carried by Mme. Bernhardt and lesser lights in La Tosca and by Lillian Russell in the Grand Duchess. How gracefully these women carry them goes without saying.

In recommending such arrangements for weddings, many things should be considered. They are especially suitable for a church wedding in spring or fall, when it would not be out of place for the bridesmaids to wear very light, airy gowns and large Gainesborough hats. But they are at their best at a suburban wedding, when there is often a little walk to the church door. It is wise also to consider the people to whom you recommend them, none better than young society ladies who are accustomed to extravagant dressing and apparently unconscious when they are the observed of all observers, for the success of the arrangements all depends upon the grace and ease with which they are carried.

Mr. Alfred Jingle would describe a wedding of this kind something in this fashion: "Egad, 'twas fine—old church—ideal wedding—sun shining—birds singing—organ pealing—flowers blooming—big crowd—carriages roll up—bridal party arrives—dainty feet on carriage steps—smiling faces—bride in white, like a lily—another beauty—hair as black as the raven's coat—eyes that look right through you—big bunch red roses—another beauty—eyes as blue as the soft sky—hair so light that it melts into the sunshine—pink roses. Egad, the color of her cheeks, and all carrying Directoire sticks and with such grace that it takes one back to Paris. 'Big odd,' 'twas the prettiest wedding of the season."

The Seed Trade.

AM. SEED TRADE ASSOCIATION.

F. BARTELDES, Lawrence, Kan., president; A. L. DON, New York, secretary and treasurer. The tenth annual meeting at Hartford, Conn., second Tuesday in June, 1892. Applications for membership should be addressed to Wm. Meggatt, chairman membership committee, Wethersfield, Conn.

Duty on Plants—Two Decisions.

NURSERY STOCK—CERTAIN GRAPE VINES DUTIABLE AS.

Before the U. S. general appraisers at New York July 13, 1891.

In the matter of the protest, 11,695 *a*, of Peter Henderson & Co., against the decision of the collector of customs at New York as to the rate and amount of duties chargeable on certain grape vines, imported per *Aurania*, March 24, 1891.

Opinion by SHARRETTS, *General Appraiser.*

The goods covered by the present protest are "black Hamburg grape vines." Duty was assessed upon the same at the rate of 20 per cent. ad valorem as for nursery stock under paragraph 282, act of October 1, 1890. The appraiser reports that "the importer claimed on entry that the vines were free of duty, under paragraph 666, N. T., as plants for forcing under glass for cut flowers," etc. This contention was abandoned, however, and in lieu thereof a protest was duly filed in which the importers claim "that said goods should be admitted free of duty under paragraph 577 of the act of October 1, 1890, as fruit plants, tropical and semi-tropical, for the purpose of propagation or cultivation."

We are of the opinion that the vines in question are not the tropical or semi-tropical plants embraced within the terms of the statute.

Many plants indigenenous to tropical countries have by cultivation become common to colder climates. Vines such as these were not intended to be admitted free under paragraph 577, N. T. That paragraph provides for plants which are themselves natives of tropical or semi-tropical countries, or which have not lost their tropical or semi-tropical characteristics by propagation in other countries.

This ruling is in harmony with the long-established practice of the treasury department. (See synopsis 1746.) We find (1) that the black Hamburg grape vines in question were imported for propagation or cultivation; (2) that they are not tropical or semi-tropical fruit plants.

The protest is overruled and the action of the collector affirmed.

NURSERY STOCK—FRUIT AND FOREST TREES AND HARDY SHRUBS.

Before the U. S. General Appraisers at New York, July 13, 1891.

In the matter of the protest, 9858 *a* and others, of Messrs. Healy & Earl and others, against the decision of the collector of customs at New York as to the rate and amount of duties chargeable on certain fruit and forest trees and hardy shrubs for ornamental purposes, imported per vessels named in the accompanying schedule.

Opinion by SHARRETTS, *General Appraiser.*

The articles in the present case were fruit and forest trees invoiced as filbert, horse-chestnut, linden, mountain ash, pear, plum, cherry, mulberry, etc., and hardy shrubs invoiced as calycanthas, snowball, althea, etc. Duty was assessed upon the merchandise at 20 per cent. ad valorem under paragraph 282 Act of October 1, 1890 as for "Nursery Stock."

The protestants claim "that the terms decoration and ornamental are synonymous, and for that reason all kinds of ornamental nursery stock are entitled to free entry under section 666 of the Act of October 1, 1890.

The Board has repeatedly held that paragraph 666, N. T., provides only for plants such as are chiefly grown under glass. In the present case we find that the trees and shrubs covered by the protest are commonly known as nursery stock, and are not such as are chiefly grown under glass, for cut flowers for decorative purposes.

The protest is overruled and the action of the collector stands affirmed.

JOHN A. SUZER, of Suzer Seed Co., is seriously ill with Bright's disease at La Crosse, Wis.

MR. LEM BOWEN, treasurer of D. M. Ferry & Co, has returned from a three months' trip in Europe.

News Notes.

SALT LAKE CITY, UTAH.—James Dwyer is building a greenhouse 21x70.

AURORA, ILL.—Irving J. Budlong has succeeded J. A. Freeman at 185 Pennsylvania avenue.

SOUTH CHARLESTON, O.—C. S. Buttin has built a greenhouse here and will grow flowers for the local trade.

CINCINNATI.—Henry Schwarz, formerly gardener for O. J. Wilson, has started in business near the old St. Joseph's cemetery, and will at once erect two houses 16x60 each.

COLLINSVILLE, ILL.—The Collinsville Nursery Company has been incorporated with capital stock of $1,000. The incorporators are John W. Staley, F. Osins, and Louis F. Lumaghi.

NEW ORLEANS, LA.—It has been decided that the coming chrysanthemum show of the New Orleans Hort. Society will be held November 17, 18 and 19, at Odd-Fellows' Hall. All exhibits for competition must be entered and placed before noon on the 17th.

MILWAUKEE, WIS.—Wm. Edlefsen is building four new houses and putting in two more boilers. Two of the houses are for roses, one for ferns and one for violets. He has also added to his business quite an establishment which he calls a wreath factory. It is a two-story building in which are employed a number of young ladies making wreaths of dried flowers, of various sizes and patterns. Mr. E. has discovered a very effective remedy for mildew but wishes to experiment further before explaining to the trade. Archie Middlemass has begun the erection of two new houses, 13x60 each, for carnations. Ben Gregory has built a large house for boarding large plants, and is making arrangements for using oil instead of coal for fuel the coming winter.

SITUATIONS, WANTS, FOR SALE.

Advertisements under this head will be inserted at the rate of 10 cents a line (seven words) each insertion. Cash must accompany order. Plant advs. not admitted under this head.

SITUATION WANTED—By a first class gardener and florist, thoroughly experienced in all branches. W N, 91 South St., Auburn, N. Y.

SITUATION WANTED—By an experienced florist and gardener; married; small family; aged 35; understands his business thoroughly. Address X W, Postoffice, Bath, Me.

SITUATION WANTED—By a landscape gardener; 25, single; can draw own plans or will work as assistant. Has a good knowledge of orchids. Address H, care American Florist, Chicago.

SITUATION WANTED—By a young man who has 11 years' experience in the growing of roses, ferns, palms, orchids and greenhouse plants. Address L, Flushing, Long Island, Postoffice box 121.

SITUATION WANTED—By practical working gardener as grower of roses carnations, violets and all kinds of greenhouse plants; 20 years' experience; married; age 35; disengaged Sept. 1. Address G, Box 54, Short Hills, N. J.

SITUATION WANTED—By an experienced gardener, single, either private or commercial; fully understands his business. Can furnish first class references. Address J E, care Am. Florist, Chicago.

SITUATION WANTED—As propagator and grower of roses, rhododendrons, clematis, stove and greenhouse plants. Commercial, or would accept position as second in private place. Address C M, 208 Dartmouth St., Boston Mass.

SITUATION WANTED—By a German florist, married; no family; long experience in all branches of horticulture; best of references; prefers to go South. Address G K, Postoffice box 410, Princeton, Ill.

SITUATION WANTED—As head gardener on private place by Englishman; aged 39; married; 25 years' experience; proficient in all branches; strictly sober and reliable; best of references. ROBERT ADDICOTT, Box 145, Glendville, Ohio.

SITUATION WANTED—By a thorough, practical gardener, who understands the forcing of roses and all kinds of flowering plants, fruits and vegetables, also grapes, both in open ground and under glass; best of references from last two employers. Address J. SCOTT, Millbrook, Duchess Co., N. Y.

SITUATION WANTED—By a practical gardener as manager of private or public grounds or large commercial plant; thorough knowledge of all branches. A successful collector and hybridizer of orchids; unexcelled in palms, stove plants, roses, grapes, etc.; rockery and landscape gardening; 20 years' experience; unexceptional references; sober; married with small family. Only a first-class position required. Address BOTANIST, Niagara Street, Pittsburg, Pa.

WANTED—A second-hand steam heater in good condition, 8 or 10 horse-power preferred. H. W. LEE Linwood, Ind.

WANTED—To lease or buy greenhouses, dwelling and land, near good market. Address H. WISE, Mt. Prospect Ave., Newark, N. J.

WANTED—A man to assist in greenhouse work; experience necessary. Wages $40 per month. Address P. O. Box 356, Maywood, Ill.

WANTED—A thoroughly competent rose grower, capable of managing a large establishment. Apply HORTICOLE. Grand Central Hotel New York City.

WANTED—A second-hand No. 22 Hitchings base burning water heater with expansion tank; must be in good order and cheap for cash. JAMES H SMITH, Milan, Ohio.

WANTED—A man who has been successful in the management of a first class horticultural establishment, including a knowledge of forestry. Apply HORTICOLE, Grand Central Hotel, New York City.

WANTED—A practical florist, single man who thoroughly understands growing roses and general greenhouse stock. Send recommendations, stating wages wanted to MRS J. P. BEAN & Co., Mt. Pleasant Iowa.

WANTED—A first class floral designer and decorator of ability and good address, for a cut flower and plant trade. Address stating experience, particulars and wages expected. J. A. PETERSON, 41 W 4th St., Cincinnati, O.

WANTED—At St. Augustine, Fla., for 3 months' engagement, commencing January 1, a young woman who is a thorough artist in the arrangement of cut flowers; must be quick and of pleasing address; one from near New York preferred. Address giving age and experience. FLOWER DEPARTMENT OF EL UNICO, Postoffice box 2832, New York City.

WANTED—First class man to take charge of a private place. Must be well up in all branches of his profession. Will be furnished good house, spare vegetables in their season and two quarts of milk daily. Must board men in his employ. Address giving previous experience, references, nationality, age, size of family and wages desired. SAMUEL THORNE, Millbrook, Duchess Co., N. Y.

FOR SALE—Seven greenhouses in Chicago, well stocked with general line of florist stuff. Four year lease of ground. Heated with hot water. Will sell for $2,000 cash. Address H R, care American Florist.

FOR SALE AT A BARGAIN.

Through sudden illness a good business in a thriving western town; 5,500 feet of glass, well stocked with everything needed for the coming season's trade. Proof, profits for the past season $1,033. The property includes a handsome house of 8 rooms, a large barn to match, wagon-shed, etc., five lots on one of the best residence streets, near depots and electric cars; supplied with city water, lighted all through with electric lights; heated by steam. Nearly two-thirds of purchase money can remain at 6 per cent. Address WESTERNER, care American Florist.

TO LET ON LEASE.

For a term of years, one of the **Largest** and most **Complete** Greenhouse establishments in the **West.** For particulars, apply to

November ———, San Francisco.—annual fall show California State Floral Society. Emory E. Smith, Sec'y, 321 Market St.

November —— ——, Little Rock, Ark.—Chrysanthemum show Little Rock Florists' Club. D. M. Tipton, Sec'y.

THE California State Floral Society has issued a premium list for its third annual fall exhibition, which will be held in October or November next, exact time and place to be announced later. Prizes for plants and cut flowers are offered in three classes: 1, Open to amateurs who do not employ skilled labor; 2, open to amateurs who do employ skilled labor, and 3, open to professionals; and there is another class open to all. This division may be suggestive to other organizations. The cash prizes amount to $230, and there are also offered two silver cups, eight silver and three bronze medals, and about $300 in special prizes. Copies of the premium list may be had on application to the secretary, Mr. Emory E. Smith, 321 Market street, San Francisco, California.

THE Horticultural Department of the Worlds Fair is still unorganized. At the meeting of the Directory last Friday evening, the appointment of Mr. J. M. Samuels was presented, but action on same was deferred. Under these circumstances the Director-General delegated Chief Allison of the Machinery Department to attend the S. A. F. convention at Toronto in the interests of the Horticultural Department.

IN THIS ISSUE we present a report of the opening of the Toronto convention, pretty complete we think in view of the fact that we had to go to press Wednesday morning. A report covering all details not presented in this issue will appear next week.

A CORRESPONDENT at Kosciusko, Miss., writes that the rose Climbing Perle des Jardins is a grand success there, surpassing in growth all the other climbers, the blooms not quite so deep in color as the Marechal Niel, but larger in size.

Joints—Without Rheumatism.

EVERLASTING HILLS JOINT.

Ten pounds ground litharge, four pounds Paris whiting, one-half pound yellow ochre, two pounds dry red lead, one-half ounce of hemp cut in one-half inch lengths. Mix well with boiled linseed oil to the consistency of thick putty. This cement will resist fire and will "set" in water.

THE USUAL THING.

Red lead in oil calked with oakum. Joints made with this can be taken apart by heating, (if you have plenty of time and heat).

THE PURSLANE JOINT.

Best Portland cement calked with oakum. If you use this joint its strength and persistence may not dawn on you until you try to get rid of it.

THE —— JOINT.

Fine iron borings, gnawings from a file or any other wearing and grinding of iron or steel. With a sprinkling of sulphur and sal ammoniac moisten slightly, make joint with rapidity and you can almost hear it grow together. What in this manner the AMERICAN FLORIST joins together let no man put asunder. The nomenclature of this joint is respectfully referred to proper committee.

Chicago. FRANK DAN BLISH.

[The above was kindly prepared by Mr. Blish at our request in response to a query by a subscriber as to best method of joining four-inch hot water pipes. Mr. B. knows several things about joints as well as the construction of boilers of the "flat top type."—ED.]

Established 1854. **Govanstown, Md.**

Please mention the AMERICAN FLORIST every time you write any of the advertisers on this page.

PANSIES.

PANSIES THAT ARE UP. Up and ready to plant when I send them. It is not only the plants that are up, the strain is up as well; up to, and most of my customers say, above any strain in the market. The price is down, considering the quality. Seed as good would cost you about as much per 1000 plants.

Price, free by mail, 100 for 75c; 500, $3; by express, $5 per 1000, with discount on large orders.

TRY THEM. THEY ARE WORTH A TRIAL.
SEND FOR LIST AND SHORT PAPER ON CULTURE.

SMILAX.

Plants have been growing, but the price has not; they are nice and stocky and ready to go right ahead. There is some 15,000 left. Let me have a chance to fill your order and do not delay it too long. Price $1.50 per 100; $12.50 per 1000, cash with the order. Sample for 10 cents.

L. B. 338. **ALBERT M. HERR, LANCASTER, PA.**

Mention American Florist.

Hydrangea Red Branched, per doz. $3; per 100,		25.00

I. N. KRAMER & SON, Marion, Iowa.

EXTRA PANSY SEED.

Mammoth Sunbeam Strain.

One of the finest and most perfect strains of mammoth Pansies in cultivation; flowers extra large, of fine form and showy colors. I have obtained this grand strain by continued high culture and careful selection, and have as choice a collection as can be procured. I receive very complimentary letters from my customers of last season. Every florist should be sure to sow of this seed. Per liberal trade pkt., 25c.; 3 pkts. 60c.; 6 pkts $1.00.

JOHN F. RUPP, Shiremanstown, Pa.

PANSIES.

Plant your frames this fall with PANSIES that will SELL AT SIGHT. You want the BEST if you keep up with the procession. My strain cannot be surpassed for size, color, or substance of flowers. I know my stock will please, and I am prepared for a big rush.

FINE STOCKY PLANTS, once transplanted, $5 per 1000 by express; 75c. per 100 by mail. Special prices on larger lots. Orders booked now filled in rotation, or on any date desired after August 15.

ALEX. McBRIDE,
ALPLAUS N. Y.

Zirngiebel's
GIANT MARKET AND FANCY PANSIES

New crop seed of those superb strains now ready, in trade packets of 1,500 and 600 seeds respectively, at one dollar each.

DENYS ZIRNGIEBEL,
NEEDHAM, MASS.

Lilium Wallichianum Superbum.

When I said that Lilium Wallichianum superbum was a very valuable acquisition I had no idea it would be indorsed as the most beautiful of all lilies. Mr. Jas. Dean exhibited before the New York Florists' Club August 10, specimens which more than confirmed the few words I said in its favor on page 564 of the FLORIST of March 19 last.

The spike of three flowers was massive and effective, the smallest flower nine inches in length and the expansion covering a diameter of the same figures. The outside tubular structure is white with reddish bronze markings. The expanded open corolla is opaque white with rich golden yellow throat. It is a gem of the first water and is all that we have expected. JOHN THORPE.

A Great Girl.

"I love that girl?"

"Why?"

"What do you suppose she sent me for a valentine?"

"I don's know."

"The receipted bill for all the flowers I sent her last year. It's taken a great load off my mind, I can tell you."—*Puck*.

Roses.

PALMS.

Kentia Belmoreana Seedlings ready for potting.

$4.50 per 100; $40 00 per 1000. Sample of 20 plants, $1.00.

H. WATERER,
109 South Seventh Street, PHILADELPHIA, PA.

2000 Violets, Marie Louise, extra large plants.
3000 Carnations, May Queen.
2000 " Hinze's White.
2000 " Portia.

These plants spread over a space from five to nine inches in diameter.

500 La France Roses in 4-inch pots.

The Violets and Carnations will all lift with a very large ball of dirt, consequently suffer very little or nothing in being transplanted.

Send in orders early to

Germination of Canna Seeds.

Noting Mr. Bassett's remarks in issue of July 30, in place of the forceps and knife with which to prepare the canna seeds we would suggest a small vice, such as may be had for twenty or thirty cents, and a file. The knife method we have found very slow and extremely tiresome to the fingers. It is by this means we prepare all our hard-shelled seeds for planting. It is a slow, tedious method, but seems to be a necessity if we are to grow the plants from seed.

AHEAD OF EVERYTHING.
We Follow None, Prize or No Prize.

Our latest improvements in machinery produce a Standard Pot which for lightness, smoothness and durability, has never been equaled. Customers buying of us will

SAVE ONE-THIRD IN FREIGHT.

And to prove this, we give below a table showing number in Crate and WEIGHT of same, which speaks for itself:

Size.	No. in Crate.	Weight.
1¾-inch	3,000	250 lbs.
2 "	2,400	250 "
2¼ "	1,750	250 "
2½ "	1,450	250 "
3 "	1,280	350 "
3½ "	800	350 "
4 "	600	350 "

It will be seen at a glance, that our pots are one third lighter than formerly, and yet we claim that owing to the superior quality of our clay and improved machinery, they are stronger than any pot in the market, and we frankly ask you to make the test. ☞ SEND FOR PRICES.

PRESIDENT James Dean and Vice-President Wm. R. Smith make a powerful team and under their leadership we may expect to see the Society of American Florists maintain if not exceed the progress it has made in the past.

WE SHALL MEET at Washington next year. Everybody wants to visit the National Capital, and without doubt the convention of 1892 will be the largest in the history of the society.

WHEN sending us small amounts in postage stamps, please select those of the 2-cent denomination.

ALWAYS mention the AMERICAN FLORIST when writing to advertisers.

The Toronto Convention.

The Toronto convention of the Society of American Florists is now a matter of history, and in spite of previous apprehensions on the part of some as to the expediency of meeting outside of the confines of the "States" it will be recorded as decidedly one of the best conventions ever held by the society. The attendance was large and those present were unusually earnest in the work of the sessions. But the entertainment feature was not overlooked, by any means, and how the Torontonians did entertain! Between the sessions of the convention it was one continual round of festivities, and good-fellowship reigned supreme. But first, to the work of the society. In this issue we will attempt to cover all the main points not given last week, and reserve for another issue the final "clean-up." All of the essays presented were of decided merit, so that selection is difficult and we shall publish at least a majority of them in full as fast as space is available.

The treasurer's report showed that the society's income during the past year was $3,344.87, and the expenditure $2,318.32, leaving a balance on hand of $1,026.55.

Mr. James Allison, acting chief of the Bureau of Horticulture of the World's Columbian Exposition, was present, and in a half hour's address told the society of the preparations that were being made for the horticultural exhibit at the great fair. He described the horticultural building and caused to be displayed on the walls of the convention hall engravings of the various buildings and plans of the exposition grounds. He asked the co-operation of the society and desired to know its wishes regarding any details in which the members were interested. A committee of five was appointed to confer with Mr. Allison on the subject. The conference was held and Mr. Allison expressed himself as well pleased with the advice and information he had received. Later the committee presented a report to the society recommending (1) immediate action for obtaining plants; (2) the making of arrangements for ample outdoor space at the fair; (3) the obtaining of the co-operation of keepers of private conservatories; and (4) that united action be taken to make the exhibit of the florists a success. The president appointed Messrs. John Chambers, Toronto; Robert Craig, Philadelphia, Pa.; John S. Bush, New York; H. A. Siebrecht, New York; and F. L. Harris, Wellesley, Mass., a committee to carry out the views of the society in this matter, and they were requested to endeavor to make the exhibit of plants and flowers at the World's Fair as fine as possible. Mr. Allison said he recognized the necessity of conforming to the expressed wishes of the society and that he would urge upon the director general the various points made. It was moved by James Dean and seconded by John Chambers that whereas, John Thorpe, the father of this society, has signified his willingness to accept the office of chief of floriculture of the World's Fair, Chicago, be it resolved that this society give to him its heartiest endorsement. The resolution was adopted.

The committee appointed to consider the advisability of the society recommending a man for the position of chief of the bureau of horticulture of the World's Columbian Exposition reported: "That it is the sense of this committee that it is inexpedient for the S. A. F. to present any name for the position, but that the society is prepared to endorse any man of high character, broad views, and good executive ability. Such men, for instance, as Wm. C. Barry, Rochester, N. Y.; P. J. Berckmans, Augusta, Ga., or J. DeBarth Shorb, California."

Washington, D. C., was selected as the place for holding the convention of 1892 and officers for the ensuing year were elected as follows: James Dean, Bay Ridge, N. Y., president; Wm. R. Smith, Washington, D. C., vice president; Wm. J. Stewart, Boston, secretary; M. A. Hunt, Terre Haute, Ind., treasurer.

The executive committee was given power to wait upon the United States government with the view of securing uniformity in the valuation of imports.

NOTES.

THE Convention Hall presented a truly international appearance, the Union Jack and the Stars and Stripes being given each about equal prominence in the decorations and they blended together almost as harmoniously as did the visitors and their hosts.

MAYOR CLARKE'S address of welcome was supplemented by words of a similar kindly character from Aldermen Score, Orr, Hallam and Leslie and Warden Massie, of the Central prison. The latter invited the delegates to visit the institution over which he presides, and assured them that they would all be permitted to return at their pleasure.

MR. THOMAS MANTON and his assistants handled the trade exhibit like old hands at the business, and spared no effort to give every assistance in their power to those making displays. The recipients of these attentions felt that some expression of appreciation was in order, and it took form in the presentation to Mr. Manton of a handsome gold watch and chain, another handsome present being also given to Mr. Walker.

THE meeting of delegates from florists' clubs was held and some good accomplished, though not nearly as much as had been hoped. It is a matter of regret that several gentlemen who had matters to bring before this meeting were unable

to be present, owing to other important engagements.

MR. BEATTY'S essay on "Credits" contained some points worth very careful consideration. We shall probably print it in full in a subsequent issue.

RESOLUTIONS of thanks were unanimously passed to the Florists' and Gardeners' Club of Toronto, the mayor, city council and citizens, Alderman Hallam, Warden Massie, the authorities of the Victoria rink, and the press.

A PORTRAIT of President James Dean will appear in next issue.

THE report of the secretary of the Hail Association showed that during the year $638.13 had been received in membership fees and $23.98 for reinsurance of glass broken. The total amount in the hands of the treasurer, after paying all losses and expenses for the year, was $1,170.40. Messrs. J. C. Rennison, Sioux City, Iowa; J. D. Carmody, Evansville, Ind.; James Horan, Bridgeport, Conn.; B. F. Dorrance, Wilkesbarre, Pa.; Edwin Lonsdale, Philadelphia, Pa.; Julius Roehrs, Carlton Hill, N. J., and J. M. Jordan, St. Louis, Mo., were elected as the board of directors for the ensuing year. Some amendments were made to the constitution. The officers elected were: Mr. J. M. Jordan, St. Louis, president; Mr. J. D. Carmody, Evansville, Ind., vice president; Mr. J. C. Vaughan, Chicago, treasurer; Mr. John G. Esler, Saddle River, N. J., secretary.

The Entertainments

A CARRIAGE RIDE.

On Tuesday afternoon the ladies were treated to a drive through the principal streets of Toronto, and after being shown the public buildings and private residences they were taken to Island Park, where refreshments were served. The ladies were afterward joined at the park by a large number of the members of the society and all enjoyed the outing.

ALDERMAN HALLAM'S GARDEN PARTY.

Wednesday afternoon the members attended the garden party tendered by Alderman Hallam at his residence at Rosedale, where that gentleman has grounds of great natural beauty which is being developed with wisdom and taste. Refreshments were served in tents and the band of the 10th Royal Grenadiers played a number of selections. A number of toasts were proposed and appropriately responded to and there was singing and recitations. The weather was perfect and all present heartily enjoyed themselves.

BANQUET.

On Thursday evening, after the bowling contest, there was a banquet at Webbs, at which the prizes were presented to the winners, and a general good time was had. Mr. J. N. May presided.

EXCURSION AND BANQUET.

Friday noon found the visitors on board the Eurydice for a sail on the lake. After a few hours afloat a landing was made at Exhibition Park, and after an inspection of the beautiful grounds and elaborate exhibition buildings all were invited to enter an annex to the main building, in which were discovered tables at which the whole party was seated and began to partake of the good things provided. After these had been disposed of, Mr. John Chambers, president of the Toronto Club, who presided, proposed a toast to "The Queen," which was responded to by all singing the British national anthem, accompanied by the band, which was with the party both afloat and ashore.

"The President of the United States" was honored with "The Star Spangled Banner" and a pleasant speech from Mr. E. G. Hill, of Indiana. He made some flattering remarks about President Harrison and the interest he had taken in the exhibition of chrysanthemums in the city of Indianapolis. The only danger of international complications he said in conclusion, was from the fact that the young men who came over had been looking after the Canadian girls, and that could be settled by the highest court of appeal—the girls themselves. He concluded by expressing his gratitude for the reception and entertainment that had been freely tendered by the people of Toronto.

Mr. Chambers next proposed "The Mayor and Corporation," calling on Ald. Hallam to respond. On behalf of the mayor, he said, speaking as a florist, he thought his worship was rather too fond of one special variety, the orange lily; yet he knew that the mayor had a good warm Irish heart.

Ald. Gibbs was next called, and spoke of Toronto as a moral and Sabbath keeping city. The crowd that was regularly turned out of the hotels at 11 o'clock every evening of the week and at 7 o'clock on Saturday evening was very small compared with the great throngs turning out every Sunday to attend divine worship. The remarkably good conduct prevailing during exhibition week each year, when a visitor might walk the grounds all day without seeing a drunken man or hearing a profane word, was a feature of which the city should be proud.

Ex-Ald. Frankland followed with an allusion to the passage by Kingsley, in which the author says that the leaves have a language, the grasses speak of the mysteries of nature and the roses have power to restore amity of feeling and good-will. There had been talk, he said, of war to the knife and of struggles for conquests between Canada and the United States. The American florists had come over here and had been taken, and seemed to be comfortable under the circumstances. He would not have known that there was an imaginary line between the two countries were it not for the interference of the customs officers. And we injured ourselves as much as any other country could injure us. On his last visit to England he had bought some presents for his wife that he did not wish any one to see, but the customs officer must meddle with them. "And, ladies and gentlemen," he said in conclusion "if you had seen that great coarse man, with a fist the size of a shoulder of mutton stirring about and turning over those presents, you would have felt as I did."

Ex-Alderman Tait, the next speaker, was in a happy vein. He was sure the Americans would not object to the Canadian habit of speaking in praise of themselves and their dignity, for it was something in the American line. The humanizing influences of these meetings would lead the people to discuss questions, not as if the two nations were opposed to each other. He hoped that the feelings prevailing in conventions would soon prevail in all walks of life, and then the thing that Ex-Ald. Frankland had complained of would disappear from the land.

"The Society of American Florists" was responded to by the retiring president, Mr. M. H. Norton, who thanked the Toronto florists for the days and nights of entertainment that they had furnished. He called for three cheers for the Toronto Gardeners' and Florists' Club, for President Chambers and for the ladies. All were responded to with a will. He concluded by reading a resolution from the visiting ladies thanking the ladies and gentlemen of the Toronto Gardeners' and Florists' Club for the kind courtesies and social favors tendered.

Judge Hoitt, of Nashua, N. H., responded to the toast "The Ladies" in an address in which wisdom and humor were nicely blended.

Mr. M. H. Norton proposed "The Toronto Gardeners' and Florists' Club." Responses were made by Mr. John Chambers, Mr. George Vair, Capt. McMaster, Ex-Ald. Joseph Tait and Mr. J. H. Dunlop.

Short addresses were also made by Secretary Wm. J. Stewart, Robert Craig, J. M. Jordan and Alderman Score. The latter on invitation from Mr. Chambers sang "Good-bye, Sweetheart, Good-bye" in a very effective manner, and Mr. Robert Craig favored the company with "Annie Laurie."

The finale was the presentation to the retiring president, Mr. M. H. Norton, of a handsome silver tea service, by members of the society, the presentation speech being made by Mr. Wm. Scott, of Buffalo. Mr. Norton accepted the gift in a brief but appreciative address.

After the banquet there was a game of crickett on the grounds adjoining and later those present were grouped and photographed.

On the boat Messrs. Wood of Boston and Farson of Philadelphia furnished much entertainment in the way of comic songs.

The weather was delightful and there was absolutely nothing to mar the pleasures of the occasion. Certainly every one present bore away with him the pleasantest recollections of his stay in Toronto and a lasting faith in the fraternity and hospitality of our Canadian brothers.

The Trade Exhibit.

Following is a list of those making displays in the trade exhibit:

Storrs & Harrison Co., Painesville, O., hardy roses.

Pitcher & Manda, Short Hills, N. J., a very large display of orchids, palms, ferns, other decorative plants and bulbs.

Robert Craig, Philadelphia, Pa., palms, ferns, dracænas and roses.

John Burton, Chestnut Hill, Pa., palms.

J. Cotterill, Deer Park, Ont., palms, ferns, orchids and decorative plants.

Edwin Lonsdale, Chestnut Hill, Pa., palms.

Wm. Tricker, Dongan Hills, N. Y.; aquatics.

H. A. Dreer, Philadelphia, palms, ferns and other decorative plants, bulbs, blooms of French cannas and double petunias.

U. S. Rubber Works, Brooklyn, N. Y., rubber garden hose.

J. D. Imlay, Zanesville, O., pansies.

A. Gilchrist, West Toronto Junction, Ont., a seedling canna, the foliage variegated pink and green shades. Very pretty and distinct.

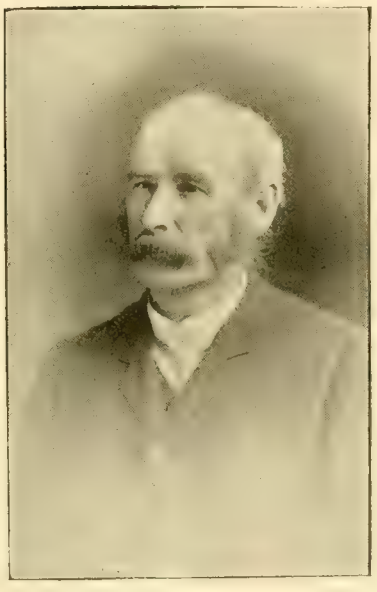
Otto Schucht, Sheboygan, Wis., geranium of the Happy Thought class.

Mrs. J. S. R. Thomson, Spartanburg, S. C., dried grasses.

H. A. Bunyard, Short Hills, N. J., chrysanthemum cut flower exhibitor, which consisted of a tray in which are placed receptacles for 24 blooms, each with an individual water holder and device for showing the bloom to best advantage.

N. Steffens, New York, wire work for florists.

H. Bayersdorfer & Co., Philadelphia,



MR. JOHN CHAMBERS.

MR J. H. DUNLOP

MR. A. H. EWING

MR GEO. VAIR

A QUARTETTE OF TORONTONIANS.

very large and complete display of florists' supplies of all kinds.

J. M. Gasser, Cleveland, O., zinc joints for butting glass.

W. C. Krick, Brooklyn, N. Y., Immortelle letters and designs.

J. A. Simmers, Toronto, Ont., bulbs, florists' supplies and tools.

W. H. Elliott, Brighton, Mass., a fine display of cut strings of Asparagus plumosa.

J. G. Heinl, Terre Haute, Ind., Cycas revoluta in various sizes.

J. C. Vaughan, Chicago, a fine display of bulbs, blooms of new cannas, tools and supplies.

C. S. Ford, Philadelphia, Immortelle letters and designs and other florists' supplies.

Lockland Lumber Co., Lockland, O., sash bars, ventilators, etc., and section of greenhouse roof.

Cefrey Florist Letter Co., Boston, Immortelle letters and inscriptions.

F. E. McAllister, New York, bulbs.

C. H. Allen, Floral Park, N. Y., a fine display of cut blooms of gladioli.

E. J. VanReyper, Belleville, N. J., glazier's points.

Astoria Nurseries, Astoria, N. Y., ferns and other plants.

F. Mitchell, Innerkip, Ont., cut blooms of tuberous begonias.

G. B. Wilcox, Bay City, Mich, bouquet pin.

E. Hippard, Youngstown, O., ventilating apparatus.

D. B. Long, Buffalo, N. Y., floral photographs.

J. A. Penman, New York, books on ferns and orchids and the Dictionary of Gardening.

W. P. Wight, Madison, N. J., tiles for bottom of greenhouse bench. These are designed to take the place of boards or slates and were very favorably commented upon by many who inspected them with interest. Mr. Wight also exhibited a shipping box for cut flowers.

Quaker City Machine Works, Richmond, Ind., the Evans Challenge ventilating apparatus.

A. H. Hews & Co., Cambridge, Mass., Standard flower pots, jardinieres, etc.

Geo. Plant, Carlton West, Ont., flower pots, vases, etc.

John Davis & Son, Davisville P. O., North Toronto, Ont., flower pots, vases, etc.

Herendeen M'f'g Co., Geneva, N. Y., the Furman boilers, the display including several sizes and styles.

E. & C. Gurney Co., Toronto, Ont., hot water boiler.

Warden, King & Son, Montreal, the "Daisy" boiler.

J. Horace McFarland, Harrisburg, Pa., samples of printing for florists.

L. B. Brague, Hinsdale, Mass., hardy cut ferns, moss, etc.

A Quartette of Torontonians.

We have pleasure in presenting at this time portraits of four of the Canadian friends who so royally entertained the members of the S. A. F. at the convention last week.

Mr. John Chambers is the president of the Toronto Gardeners' and Florists' Club and is superintendent of the parks of Toronto. He is an able man in his profession and a jolly good fellow too. Any one who hasn't met John Chambers has missed a great deal.

Mr. J. H. Dunlop is vice-president of the Toronto Club, and a rose grower of marked ability. He has a splendidly kept establishment and is right up toward the head of the procession. Mr. Dunlop is a worker, and to his energy a full meed of credit for the success of the convention is due.

Mr. A. H. Ewing is the secretary of the Toronto Club and an all round good fellow. He is gardener at the Normal School and is recognized as a thorough plantsman and fully alive to the responsibilities of his position and ready at all times to do all in his power for the advancement of his profession. He did much hard work in connection with the preparations for the convention.

Mr. George Vair is head-gardener for Sir David Macpherson at Chestnut Park, which position he has occupied for 35 years. But he is only a boy in heart yet, and though wrapped up in his life's work, in which he takes the deepest interest, he can heartily enjoy the society of "the boys" and his presence in any gathering is always a source of pleasure to those with whom he comes in contact.

The Bowling Contest.

Thursday afternoon the bowling teams took possession of the Victoria Club Rink alleys. The Victoria Club was not to be outdone in the matter of hospitality, and in addition to freely giving the use of its bowling alleys it made each of the visiting florists a member of the club for the day. Six clubs entered, representing Philadelphia, New York, Boston, Buffalo, Chicago, and Toronto. There was a large crowd present to witness the contest and there was no lack of enthusiastic applause for well directed and successful work on the part of the players.

The first prize cup, of which we gave an illustration in the convention supplement, is a handsome trophy. The beaver at the top is of oxydized silver on a gold maple

branch. The two balls that rest at the base are also of oxydized silver, the rest being of plain silver, with gold ornamentation at various points. On one side is engraved the figure of a bowler in the act of delivering a ball and on the other the inscription within a finely chased wreath: "Presented by the Toronto Gardeners' and Florists' Club, Toronto, August 20, 1891." This elegant prize was won by the Philadelphia team, but only after a prolonged struggle. On the first two games it was found there was a tie between New York and Philadelphia for first place, each having 1,848. This was difficult to believe at first, as a tie under the circumstances seemed almost incredible, but no errors in addition could be found and these two teams had to play a half string to decide the contest. And Philadelphia won.

In addition to the handsome first prize there were five other prizes furnished by contributions to a sweepstake among the clubs. These were a silver cup valued at $25 for the club making the second highest score, a silver cup valued at $18 for the club standing third on the list, and three diamond pins valued respectively at $15, $10, and $7.50 for the three highest individual scores. Of course there was the inevitable booby prize, consisting of the delapidated remains of a stuffed beaver for the club at the foot of the list.

The following are the scores:

BOSTON.

	1st Game.	2d Game.
W. H. Elliott	167	162
Thos A. Cox	137	129
W. Edgar	139	150
F. W. Foster	115	140
McCarthy	127	114
L. H. Foster	146	142
Totals	831	837
		1,688

PHILADELPHIA.

	1st Game.	2d Game.
G. Anderson	148	159
E. Lonsdale	111	176

A. Ringier	144	135
F. F. Benthey	152	111
J. C. Vaughan	111	100
J. D. Raynolds	88	108
Totals	795	785
		1,580

TORONTO.

	1st Game.	2d Game.
McPherson	75	127
Foster	106	96
Dietrich	60	117
Muston	125	124
Vair	68	120
Arnolds	100	139
Totals	534	723
		1,257

Philadelphia and New York being a tie for the first place with 1,848, played off a half string with the following result:

PHILADELPHIA.		NEW YORK.	
Anderson	77	Roehrs	94
Lonsdale	89	Forsterman	86
Brown	71	Asmus	48
Craig	75	Burns	66
Westcott	110	Allen	64
Kift	58	Manda	74
Total	480	Total	432

The result gives Philadelphia the first prize, with New York second and Boston third. The following are the prizes for individual scores: First, Mr. G. L. Grant, Chicago, 193; second, Mr. Alex. Burns, New York, 184; third, Mr. I. Forsterman, New York, 179.

NOTES.

George Anderson, the captain of the Philadelphia bowling team, was so proud of the cup he had won that he couldn't wait to take in the excursion on Friday, but left Friday morning to take his trophy home.

Lonsdale needed no advice. In fact, no advice was good advice for him. With advice thrown at him he made 111, but without advice he accumulated 176.

All hands agreed that the alleys were crooked, and when the New Yorkers were so far ahead the Philadelphians suggested that the reason they got along so well on the alleys was because they were crooked themselves, but when the situation was reversed the Philadelphians dropped this theory as untenable.

The Toronto team made a noble showing for players making their first effort. Look out for them at Washington.

Deacon Harris, of the Philadelphias, is offering odds that his average in the next practice games will admit him to the team next year.

The booby prize, a stuffed beaver with ribbons in its whiskers, fell into the hands of the Torontonians. Capt. Geo. Vair did some grand work toward securing this much coveted prize.

At one time it looked as if New York had the first individual prize, but the fates decreed that it should go to Chicago.

John Thorpe acted as mascotte in general and rallied the boys all along the line. John says he is a cosmopolitan now.

Vice President Smith says that alleys will be built especially for the contest at Washington next year, and that they will be beyond criticism.

Tall Vase.

The vase seen in the illustration is one of several that we have for high table decorations. The flowers in this case are by no means what we would advise, but they serve to show the vase and size of cluster that we would recommend. The vase is thirty inches high and when put on a dinner table the obstruction by the narrow shaft is very slight, the flowers coming above the line of vision. If the chandelier is over the center of the table and this style of decoration is desirable, we use two vases, one at each end. When these vases are used it is also necessary to have flowers arranged in some low form on the table. Fine long stemmed chrysanthemums are among the best flowers to use. Lilium auratum, acacia, long ferns and long sprays of some of the orchids are very effective.

H. H. BATTLES.

Subtropical Planting.

BY DAVID ALLAN, MT. AUBURN, MASS.

[*Read before the Toronto Convention of the Society of American Florists.*]

Our high summer temperature is greatly in favor for the growing and planting extensively of this most gorgeous, interesting and highly decorative class of plants. There has been a great deal of prejudice against them by the gossip—that they are expensive; but this is not so. They are like all other plants; some are expensive and some are not. For instance: An effective bed or border of such plants as castor beans, cannas in variety, amaranthus, Eulalia japonica and other grasses can be had for a moderate sum.

Then again, such plants as palms, cycads, tree ferns, musa, dracænas, etc., cannot be grown or furnished without expense. A mixture of the former and the latter has a grand effect, for the noble palm will always keep its place.

Some good ones for that purpose are Chamærops excelsa and Fortunei, Cycas revoluta, Seaforthia elegans, Latania borbonica, Phœnix rupicola and its many varieties, Areca lutescens and sapida, Caryota urens and Sobolifera, and hosts of other cool growing, noble palms.

Dracænas well worthy of a place are D. australis, D. Draco, D. indivisa variegata, D. Guilfoyleii. The bright-colored varieties such as D. terminalis and the garden hybrids, do not succeed well unless planted in shady places.

Tree ferns, Cyathea Cunninghami, C. dealbata and C. excelsa, Dicksonia antartica, D. aborescens and D. davallioides. Many of our hardy ferns can be used with fine effect in the subtropical garden, such as Adiantum pedatum, Osmunda regalis and cristata, O. cinnamomea, O. Claytoniana and O. gracilis; Struthiopteris germanica and S. Pennsylvanica. Several Japanese varieties do well, as Woodwardia radicans and W. japonica, Asplenium Felix fœmina and others.

Of ornamental grasses there are many fine varieties, but some are not hardy, except in certain soil. For instance: Eulalia japonica will not winter with me in a heavy, clayey soil, but across the river, in a gravelly soil, it stands first rate. Therefore, we with the heavy soil have to store them away in cold cellars. That is the way Robert Fortune tells us the Japanese shelter their subtropical plants; having no greenhouses, they resort to cellars and sheds.

Some good varieties of the above are Gynerium argenteum, Arundo conspicua, Agrostis nebulosa, Arundo donax, Agrostis elegans, Eulalia japonica, Hordeum jubatum, Eulalia folius striatus, Lagurus ovatus, Eulalia zebrina, Panicum palmifolium, Briza maxima, Panicum virgatum, Briza minor and Pennisetum longistylum.

The rapid improvement with marvelous results in the raising of new flowering cannas by M. Crozy and M. Lemoine, of France, will have a sure tendency to boom all subtropical plants for outdoor summer decoration in the pleasure ground.

Some favorable places for subtropical planting are the open squares, called court-yards, of large hotels and other buildings similarly situated. There the

TALL VASE.

banana would make a perfect leaf without being torn with the wind. In such places palms, dracænas, cannas, caladiums, musas, etc. would be appropriate. It would be a consideration of profit and gratification to proprietors, as well as to the nurserymen supplying such, and rendered doubly so if the same space were filled in the fall with retinosporas in variety, or other coniferæ. All subtropical plants like a rich, deep extra well manured soil.

Of cannas there is now an endless variety, but we cannot dispense with all the old ones for the sake of their effective foliage, such as Nigricans, Liliiflora, and Indica. Of all the new dwarf varieties nothing can excel their brilliant color on the lawn. We have now flower spikes in summer with trusses like rhododendrons in spring. My friend, Mr. E. Lonsdale, regrets the want of good self yellows, and perhaps rightly so. I see good self yellows coming up among the dwarf seedlings. Still, beds of such varieties as Admiral Courbet and Mme. Just have a golden display in the flower garden I have not seen equaled in midsummer since I left the herbaceous calceolaria in old England fifteen years ago. Oncidium, spotted varieties—such as Francois Corbin—are more effective in borders than massed in beds, but such varieties as Jules Chretien, Mme. Crozy, Princesse de Lusignan, Paul Bert, Admiral Courbet, Mme. Just, Thos. S. Ware, La Guill, Sir de Jeanne Charreton, Jacquemot Bonnefond, M. Cleveland, Star of '91, Gen. de Negrier, Antoine Chantin, are all grand massed in beds, each variety separate, being sure that the beds are well manured and have an abundance of water after planting.

Other good plants suitable for subtropical work are: Acacia lophantha, Rhus glabra, Acanthus glandulosa, Yucca aloifolia, Aralia japonica, Yucca gloriosa, Aralia spinosa, Tritomas in var., Bambusa falcata, Nicotianas in var., Bambusa japonica, Caladium esculentum, Ficus elastica, Malva crispa, Musa ensete, Humea elegans, Solanum robustum, Amaranthus salicifolius, Celosia pyramidalis.

Phormium tenax is a rather stiff plant, but it will do to put in windy corners to shelter the others. A few of the best single dahlias look well intermixed. Tuberous rooted begonias in favored shaded places, also some of the strong growing spotted caladiums. Should the object be to hide some building, if brick or stone, plant Ampelopsis Veitchii, as hardy plants; also Bignonia radicans and B. radicans grandiflora to hide wooden fence back of subtropical borders.

Review of New Plants.

BY WM. FALCONER.

[*Presented at the Toronto Convention of the Society of American Florists.*]

(CONCLUDED FROM LAST WEEK.)

AQUATICS.—BY MR. E. D. STURTEVANT, BORDENTOWN, N. J.

He writes: I introduced the following new aquatics here last year (1890):

Nymphæa Marliacea chromatella.—This variety deserves unstinted praise. The petals are of a delicate yellow color and the stamens deep yellow; and the flowers are of fine form and fragrant and produced continuously from early summer till fall, long after N. odorata has ceased to bloom. It is of the easiest culture and perfectly hardy.

Nymphæa Marliacea var. rosea.—Flowers pink, somewhat lighter in color than those of N. odorata var. rosea. Have grown it for two or three years.

Nymphæa Marliacea var. carnea.—Flowers, delicate flesh color. Both this variety and the last named one bear fine flowers and for a long period, and both are hardy.

Eichornia (*Pontederia*) *azurea* I introduced in 1890. In habit it is quite distinct from E. crassipes as it has a creeping stem which rambles in shallow water as a verbena does on land.

Limnanthemum Indicum—Though not new in Europe, it is so here. Its white flowers are about the size of a silver quarter to half dollar and delicately feathered on the entire upper surface, making them resemble snowflakes. The plant flowers freely all summer and is easily wintered under glass.

Victoria Randi is the name now given to the new variety of Victoria regia.

ANNUALS.—BY W. ATLEE BURPEE & CO.

Asters.—Among the best are Comet, Queen of the Market, and The Diamond.

Balsams.—The Defiance strain has the largest and most double flowers; individual flowers measure 2 to 2½ inches through.

Calendula Oriole, or large flowering bright yellow, is a very large, golden yellow flowered variety, and Royal Marigold Trianon has sulphur yellow blossoms as big as those of Oriole.

Carnation, Marguerite strain.—About 80 per cent come true from seed.

Dianthus, Dwarf Fireball.—Blood red. Fine for late summer and fall cutting.

Euphorbia heterophylla makes a good pot plant for the greenhouse in fall.

Lobelia compacta oculata.—Distinct, robust compact, free blooming; good for bedding or as a pot plant.

Candytuft, Empress—An extra fine strain of Rocket.

Nasturtiums—Aurora, yellow, lower petals spotted with crimson; Brown Red, a rich shade, and Brilliant Yellow, well described in name, are the best of the recent additions.

Petunia.—The Defiance strain is a fine selection of the best of the grandiflora type.

Phlox Drummondii.—The Fordbrook strain of grandiflora has very large flowers of a wide range of color. The Star of Quedlinburg varieties have been improved immensely of late in size and form and it embraces about forty shades of color.

Salvia farinacea is a Texas perennial but grows well when treated as an annual. Flowers blue, or silvered blue, in long, close spikes. Easy to grow, free blooming and lasts long in flower.

Pansies.—Defiance strain has very large, circular flowers of fine substance; individual blooms measure 2½ to 4 inches across.

Poppies—Among Ranunculus-flowered varieties Golden Gate and Shirley are unsurpassed; and Fairy Blush is the most beautiful of the large flowered poppies.

Sweet Peas.—Blanche Ferry (or Nellie Janes) is the most profuse and earliest variety. Among the new varieties we would recommend Primrose, a near approach to yellow; Splendor, bright pink; Purple Prince, maroon and purple; Queen of England, white; Boreatton, maroon; Mauve Queen, white, delicately shaded with mauve, and Orange Prince, orange, pink and rose.

Among other plants we would especially recommend the orchid water lily (Pontederia crassipes major). It flowers better when grown in a tub of water on the lawn than in deep water.

MISCELLANEOUS PLANTS.—BY PETER HENDERSON & CO.

Mimulus Moschatus fl pl.—A novelty of much interest. Flowers quite double; whole plant as fragrant as the single-flowered one. A good grower, easily raised from cuttings and a fine pot or basket plant.

Impatiens Sultani fol variegata—Foliage edged and marked with silvery white; otherwise in manner of growth, brightness and profusion of bloom, like the typical form.

Double Show Pelargoniums—They appear to be equal to what the raisers claim for them, but they are too new yet to us, however, to say much about them.

Geraniums—Among very promising new ones are Souvenir de Mirande, Alphonse Daudet, Panache de Nancy, Glory of Lyons, Beaute de Poitevine, W. P. Simmons, Trophee, Mrs. E. G. Hill, Amphlett, Mme. Legros Lacaille, California (this being an improvement on Golden Dawn in point of habit) Le Cid, M. Caro, Beauty of Ramsgate and Copernic.

Carnations.—American Flag, Lizzie McGowan and Louise Porsch (the best yellow, perhaps, on the market to-day) are capital varieties.

Roses—Mrs. Degraw, Climbing Niphetos, Climbing Perle des Jardins, Ruby Gold, Gloire de Margottin, Jeannie Dickson, and Clotilde Soupert have proven worthy of favorable mention.

MISCELLANEOUS PLANTS.—BY JOHN SAUL, WASHINGTON, D. C.

Aralia Cashmeriana—A hardy, herbaceous plant of vigorous proportions and fine foliage.

Cienkowskia Kirkii.—A handsome plant from Zanzibar; though not quite new, is seldom grown. It requires a warm house during summer, and to be dried off and kept warm during winter. Flowers purplish rose, with a bright golden spot.

Dichorizandra (*Cyanotis*) *Zanonia* is a very beautiful plant of shrubby habit in foliage and appearance the counterpart of Tradescantia zebrina, save habit. As it is of fine growth and easy to grow it will be largely grown.

Gladiolus Nanceianus—Of this new strain of Lemoine's I have several now in flower. Comte Horace de Choiseul, Charles Baltet, President Carnot and Maurice de Vilmorin are fine.

Gloriosa superba and G. Plantii (virescens) are old but fine plants. The first-named needs a warm house; the last-named can be planted out during summer, when it grows freely to a moderate trellis, and its roots should be lifted and kept dry and warm over winter. Both are vines.

Overa pulchella.—A beautiful vine from New Caledonia. Has many flowered cymes of white blossoms in winter.

Phrynium variegatum, from Singapore. An elegant plant allied to the marantas, and requiring same treatment. Leaves pale green, blotched and variegated with white. A free growing and very valuable plant.

Reinwardtia tetrigynum.—A little shrubby Indian plant with sulphur yellow flowers. It is a capital greenhouse plant, and of the easiest cultivation. It is not new, but a plant deserving wider recognition.

Senecio pulcher.—Bedded out in summer, it flowers freely after July, and is very beautiful. Lift before frost comes and keep it cool but free from frost during winter. Propagates freely from pieces of the root.

Aranja (*Schubertia*) *grandiflora.*—A climbing plant bearing clusters of large, very sweet-scented white flowers. Although not quite new, it is too little known.

Tecoma Amboinensis—A handsome stove climber bearing racemes of large, orange-red flowers.

Tecoma Ricasoliana (Mackenii).—As this plant comes from South Africa we may expect it to prove hardy in the Southern States and Southern California. It bears magnificent racemes three to four feet in length of large, showy, trumpet shaped flowers of a rosy-lilac color. It has done well with me.

Wistaria Multijuga.—This is the Japanese species, with racemes three feet long, and which we see so often in pictures of Japanese gardens. I have had it for over twenty years. I have a large plant in bush form; when it flowers it is one of the most beautiful objects I have ever beheld; delicately and gracefully pendant from it hang innumerable two to three feet long racemes of flowers.

Cultivation of the Tuberous Begonia.

BY JOHN CHAMBERS.

[*Extract from paper read before the Toronto convention of the Society of American Florists.*]

The cultivation of the tuberous begonia, also the propagation of the same, may be of some little interest to you, so I will give a short outline of the general methods practiced by myself and of those who have made the tuberous begonia a specialty. It is a case of "first catch your hare and then cook him," that is, you must either start with seed or bulbs, or both, which you may either beg, borrow or steal. The seed should be new. If you have any shallow pans clean them thoroughly, use plenty of "crocks" at the bottom, mix a nice light compost of peat, a

CYPRIPEDIUM BROWNII.

little well decayed leaf mould and sharp sand; after covering crocks with a little dry moss to keep the soil from running among them, fill pan to within one-half inch of the top, press lightly, sow your seed very thin (this is an important point) and cover with a thin layer of silver sand, water well and cover with a piece of glass, and shade from the direct rays of the sun. As soon as large enough to handle prick out immediately into shallow pans with as little delay as possible, as this is one of the secrets of success. Keep shifting into larger pots until the time arrives for rest, gradually dry off and place in a dry shed or cellar. The seed should have been sown as early in the spring as possible.

Now that you have nice young tubers (unless you want to sow another packet of seeds) knock them out of the pots carefully, throwing away those that have been attacked with dry rot. Procure a few shallow propagating boxes and some leaf mould, place them in this about one inch apart till they commence to start and make a few roots, by which time you will have had some clean 5-inch pots ready for their reception. A nice light potting soil will do for this shift, but when it comes to 7, 10 and 12-inch pots, which you can easily shift them into in one season, the following is a good recipe: Say to 50 parts of good fibrous turf add 25 of good peat and 10 of leaf mould, 10 of sharp sand and 5 of good rotted manure or bone dust. Mix thoroughly and pot lightly. Begonias of this section are gross feeders, so when they have had their last shift and the pots are full of roots a good top dressing and a liberal supply of liquid cow manure applied three times a week will help them wondrously. Some varieties will require pinching, but one must be guided by common sense in this respect. A light, airy, span-roofed house is the best place to grow them, with plenty of shading on sunny days. Syringing in the early part of the day is also very beneficial. Tobacco stems placed around the pots will help to keep down green fly.

For bedding a partially shaded situation suits them best and they should be planted in from 4 to 5-inch pots. Keep well watered and they will well repay any trouble in that direction.

Cypripedium Brownii.

This new hybrid was obtained by crossing C. leucorrhodum with the pollen of C. magniflorum.

The growth and leaves are similar to C. leucorrhodum; flower nearly one-third larger than those of leucorrhodum in all its parts. The dorsal sepal incurving, white shaded with rose and green blotch at the base, the lower sepal very large, nearly pure white; petals broad and flat, with bright, rosy ends; lips large, roundish, rosy purple, with a greenish cast.

This distinct hybrid, which is the first selenipedium hybrid raised in America, was raised in a little over two years. The seed was sown March 1, 1889, and germinated July 26 of the same year, and flowered May 12, 1891, thus beating all the selenipedium hybrid records.

This beautiful hybrid is dedicated to D. S. Brown, Esq., of St. Louis, an ardent lover and happy possessor of a large collection of this genus.

JOSEPH MANDA, JR.

Propagation of Carnations.

[IN RESPONSE TO QUERY BY W. E H.]

The rooting of carnations from cuttings is a very simple process if anything like proper conditions be maintained. If strong healthy cuttings are taken from the plants any time in December, January or February and placed in a sand bed, where an even temperature of from 50° to 60° can be kept up and something like an even degree of moisture maintained, they may be depended upon being well rooted in from four to six weeks with very small loss.

Probably the most important feature

in carnation culture is the even degree of moisture to be maintained and this is more particularly the case in regard to the cuttings. It must be remembered that if carnation cuttings are allowed to become very dry and wilt even in a small degree the chances of their rooting are reduced to a minimum; then again, the continual watering is a decidedly objectionable feature which seems to point to the fact that a situation where the cuttings can be well watered when first put in and require but little afterward is just about right because an excess of water is just as injurious as too little, inasmuch as too much water will cause lower ends of cuttings to turn black, and then goodbye to all chances of rooting.

My main carnation cutting bench faces the west. Early in the fall I cause the glass to be painted inside with a thin mixture of white lead and crude petroleum, which seems to so modify the sun's rays sufficiently without causing darkness as to be just about right; last winter and early spring I rooted from three to three hundred and fifty thousand cuttings on this bench, with an average loss of not over five per cent.

H. E. CHITTY.

Paterson, N. J. Aug. 18, '91.

Palm Notes.

STEVENSONIA GRANDIFOLIA.—This very handsome species can hardly be included among florist's palms, that is to say as a suitable plant for decorating, the foliage being too tender to stand much exposure. It is, however, admirable as a specimen for exhibition, the leaves of a large plant being seven to eight feet long and three to four feet in width, bifid at the apex and the edges cut into short segments, while the leaf stalks are densely armed with long black spines. Stevensonia grandifolia is essentially a warm-house palm and enjoys an abundance of moisture both at the root and in the atmosphere, and grows best in a light compost in which peat predominates.

RHAPIS HUMILIS.—This graceful palm is more elegant in appearance than the well-known R. flabelliformis and like the latter is of sufficiently hardy constitution to be very useful as a decorative plant, the only objection being its comparative scarcity. The flabellate leaves of this species are not so stiff as those of R. flabelliformis and are more finely divided, the segments being pendulous. When grown in a warm house R. humilis soon makes a handsome plant, its habit of growth being somewhat more compact than that of its congener, but as there are no seeds of either of these species of rhapis offered in the market at the present time, division has to be depended on as a means of increase and consequently these useful palms continue to be rather high priced for ordinary work.

LIVISTONA ALTISSIMA.—The subject of this note is a noble palm and deserving of much wider distribution, for while it is by no means new, yet it seems comparatively rare. It is of somewhat similar habit to the ever-popular Livistona chinensis (Latania borbonica) and has bright green fan-shaped leaves on long foot stalks, the latter being armed on the edges with recurved black spines and the base of the stems surrounded with brown fibres. Livistona altissima also thrives best in a warm house and moist atmosphere, and under favorable conditions makes a remarkably handsome specimen. Another fine species of this genus is L. rotundifolia, the leaves of which are divided into very narrow segments and of dark green color. The latter species attains considerable size ultimately, but is most ornamental for ordinary purposes, when in an eight or ten-inch pot.

CEROXYLON NIVEUM is a strong-growing palm of great beauty, the leaves when fully characterized being pinnate and the pinnæ being about two feet in length, often reaching ten or twelve feet in length, dark green on the upper side and silvery white beneath. When the plant is young the leaves of Ceroxylon niveum are entire, and even in this condition the leaves are often five feet long, but present a very different appearance to the fully developed foliage. This species does not require a very high temperature in which to flourish, but like many other palms will make more rapid progress under warm treatment.

GEONOMA SCHOTTIANA is also a very graceful pinnate-leaved species and might be briefly described as a large-growing Geonoma gracilis, the habit of this plant being much like the latter. Geonoma Schottiana has a slender stem and leaves from three to four feet long, the leaflets being narrow and pendulous and the plant compact in habit. The geonomas having rather thin leaves are sometimes attacked by red spider when not thoroughly syringed, and in order to avoid this pest should be liberally treated in regard to water and a moderately warm temperature will be found most satisfactory.

W. H. TAPLIN.

The Lace-Leaf Plant.

This is a plant of exceedingly interesting structure, and, at the same time, one of the most beautiful occupants of our greenhouses. It is commonly known as the "Lace-leaf" or "Lattice-leaf Plant." The scientific name is Ouvirandra fenestralis, the former from the native name, *Ouvirandrano*, translated as "Water Yam," in reference to the edible roots, and the latter from the latin *fenestra*, signifying a window. It is within five years of being a century since the plant was first discovered in Madagascar, its native country, by Aubert du Petit—Thouars. This botanist thought it sufficiently distinct for a creation of a new genus, and thus it came to be described and figured by him under the above name. The genus originally comprised only three species, viz., O. fenestralis, O. Bernieriana, inhabiting the same region as the former, and O. Hendelotii, a native of Senegambia and not known in gardens. But the ouvirandra is closely allied to aponogeton, and some years after its being established four species from the latter genus were added, making seven in all. Now, however, the best authorities, Hooker and Bentham, include all the species under aponogeton; but, notwithstanding this, the plant under notice will be known as O. fenestralis for many years to come.

The authorities at Kew considered themselves fortunate in securing specimens of O. fenestralis, in press and in alcohol, about thirty years after its discovery, and it was not until 1855 that the Rev. William Ellis was successful in conveying live plants to England. O. Bernieriana was introduced through the same gentleman three years later. Both plants are true aquatics, growing, in their native habitat, on the margins of running streams. They are occasionally met with in gardens, and differ from all other cultivated water plants in that their leaves always remain underneath the surface, the flowers alone ascending beyond.

O. fenestralis has fleshy, rhizomous roots, which the natives of Madagascar use as an article of food. The curious leaves, proceeding from the root in spreading clusters, attain to a total length of two and a half feet, about one-half of which is taken up in the slender petiole. The blade of the leaf, by far the most remarkable portion of the entire plant, varies considerably in outline, and a good specimen will measure from five to six inches across at the widest part. It is generally oblong, with slightly undulating margins and blunt tip. The apex, however, is often the broadest portion, with a prominent depression, the margins sloping gradually in curved lines to a pointed base. It is traversed on either side of the mid-rib by several slender, equidistant fibres, which run parallel with the margin from base to apex, and are connected by means of numerous and still more delicate horizontal lines or nerves. The whole fabric reminds one of a perfect skeletonized leaf, or a piece of lace of exquisite workmanship, the color being dark green.

The scape resembles the petioles; and rises in autumn from a cluster of the leaves, exceeding them in length somewhat, and developing at the top, just above the water, two spikes, each from three to four inches long, of creamy white flowers, which are of little account individually, but by no means despicable in the compact masses.

O. Bernieriana bears a strong resemblance to O. fenestralis. The leaves, however, are longer and narrower, the petioles only about one-fourth of their entire length, and the interstices of the blade smaller, there being a tendency to fill the spaces between the nerves, and thus assume an appearance more like that of ordinary plants. The scape also differs in having four instead of two spikes of flowers, the color being white with a tinge of pink.

A specimen of O. fenestralis grown by Mr. Richard Gardner, in a stove on the beautiful grounds attached to the Newport, Rhode Island, residence of Cornelius Vanderbilt, Esq., was the finest I have seen. This plant attracted a great amount of attention at a recent exhibition of the Massachusetts Horticultural Society, and its appearance of healthy luxuriance fully merited all the praise bestowed upon it. Late last autumn, in the course of an inspection of Mr. Vanderbilt's garden and greenhouses, I carefully examined this plant. It had been planted in a pan which was placed in a tub two feet deep, four feet in diameter at the top and filled to the brim with water. There was not an inch of space to spare anywhere in the tub, and some of the largest leaves, to their disadvantage, were forced to float partially on the surface. The plant bore numerous scapes in all stages of development, and certainly not less than 200 full-sized leaves, besides many others of inferior dimensions.

The culture of the Lace-Plant is not difficult, but there are certain peculiarities about it in this connection which demand attention. It requires a stove temperature and should be potted in a rich compost. Two parts of rich fibrous loam to one part of thoroughly decomposed cow manure, with the addition of a liberal quantity of coarse, sharp sand, and, in the case of extra large specimens, a few pieces of charcoal and a little bone meal make an excellent mixture. The plant should then be completely immersed in a tub containing clean water, the longest leaves being at least two inches beneath the surface. A quantity of fresh water should be introduced daily, and care

LEAF AND INFLORESCENCE OF THE LACE-LEAF PLANT.—(OUVIRANDRA FENESTRALIS).

must be taken to keep the plant free of the deleterious green substance which accumulates so rapidly in standing water. To be successful in potting it is necessary to perform the operation while the plant is in active growth and not when it is resting or partially dormant. Mr. Gardner informs me that he believes O. fenestralis may be dried off in the manner so successfully pursued with Aponogeton distachyon, and this is supported to some extent by the evidence of the introducer. "I was informed," says Mr. Ellis, "that it also grew in places which were dry at certain seasons of the year; that the leaves then died down, but the root buried in the mud retained its vitality and when the water returned fresh leaves burst forth. The natives spoke of it as tenacious of life and said that whenever the earth around, even the smallest portion of it, remained moist, that portion would put forth leaves when again covered with water."

I have never been able to keep this plant alive for any considerable period when the vessel which held the water has not been constructed of wood. Glass and earthenware contrivances have been successfully employed by other growers, among whom I find the late Mr. B. S. Williams, who was a famous English nurseryman, but they have invariably been absolute failures with me. A knowledge of how to properly manage the plant in a tank constructed of glass would appear very desirable, such a structure permitting of the leaves being seen in all their beauty. My experience in this direction, however, has not been altogether exceptional, for in *The Garden*, during last March, Mr. Owen Thomas—gardener at Chatsworth, the celebrated horticultural establishment of the Duke of Devonshire—alludes to the matter as follows: "A wooden vessel to hold the water is preferable to any other. I remember some years ago sending a plant to Mr. Latham, of the Botanic Gardens, Birmingham. This he placed in a glazed earthen vessel and tended with the greatest care, only, however, to see it languish and die in a short time. I advised him to use a wooden vessel for his next plant, which he did, and he has since succeeded in its culture very well."

Some speak highly of the advantages to be derived from using rain water. This, however, is not strictly necessary. I have employed that which appeared handiest, rain, spring, pond or city—provided it was clean and warmed in winter by being stood in a tin watering-pot close to hot pipes for an hour or so previous to application—and have proved all kinds to be of equal utility.

Large, established plants ripen seeds freely, and propagation may be effected by sowing these, or by division of the roots. The former is the most satisfactory method. The seeds, if allowed to fall, will ultimately deposit themselves about the base of the plant, where they will germinate. The young plants very often perish soon afterwards, however, on account of their too great distance from the surface. Mr. Gardner's plan of raising seedlings is a very good one, and I give it here in his own words: "My method is to collect the seeds as soon as ripe, that is, when they fall upon the water, where they float for a day or two, and sow them immediately in a shallow pan containing water and a little sand. The process of germination takes several days, after which rootlets and leaves speedily make their appearance. I plant the seedlings in small pots containing rich sandy soil, when they have made two leaves, and place them in a tub of water, about one inch below the surface. Good plants may be obtained in this way very quickly."

I have to thank Mr. Gardner for the leaf and inflorescence of O. fenestralis from which the accompanying drawing was prepared, and for his general willingness to impart information likely to interest the horticulturists and florists of the world.

M. BARKER.

Cambridge, Mass.

Has Four Cutlers.

The *Register*, of Norristown, Pa., is responsible for the following: "Mrs. Heebner, No. 18 White Row, has raised a curious flower, which is known as a White Dallas, and is the shape of a perfect human face and closed up like a ball. The flower has four cutlers and has been much admired." This is certainly a most remarkable novelty.

News Notes.

CEDAR FALLS, IOWA.—Joseph Bancroft is building a rose house 20x93 feet.

ST. PAUL, MINN.—Messrs. Venzke Bros. have added a new rose house 20x100 this summer.

SAN DIEGO, CAL.—Mr. E. Benard, Jr., the florist and nurseryman, and Miss M. Herkert, were married August 11.

CLAY CENTER, KAS.—Charles Humfeld has purchased land at this place and is erecting three greenhouses 10x100 feet. Hot water will be used for heating.

HAMILTON, ONT.—The Electoral District Horticultural Society, assisted by the Gardeners' and Florists' Club, will hold a fall exhibition September 22.

DULUTH, MINN.—L. S. Swanson, who has conducted a florist's store here for a year past, is reported to have left town, leaving quite a number of unpaid bills behind him.

JERSEY CITY, N. J.—Messrs. Peter Henderson & Co. have added four large houses for growing cut roses and wood for propagating; some of the old houses are also being rebuilt.

LOWELL, MASS.—The employes of E. Sheppard & Sons, to the number of fourteen, enjoyed a very pleasant outing August 13 at Tyng's Island. The day was passed in sports and games.

MINNEAPOLIS.—The Society of Minnesota Florists will hold their annual meeting at White Bear Lake, Thursday, September 10. Business meeting and election of officers will be attended to in the forenoon, and the afternoon devoted to social pleasure and picnic.

GLOUCESTER, MASS.—The Cape Ann Horticultural Society will give an exhibition at the City Hall September 25 and 26. The committee in charge feels confident of a large exhibit, as a renewed interest in horticultural affairs is being manifested in this section.

BALTIMORE.—Owing to the removal of Knapp's building meetings of the Florists' club now take place at Raine's hall, corner Baltimore street and Postoffice avenue, on the second and fourth Monday of each month as before, and not on Tuesday, as stated in a recent issue of the FLORIST. Annual election of officers takes place the fourth Monday in March.

BELLEVILLE, N. J.—Mr. E. J. Van Reyper, the florist, had an unpleasant tussle with highwaymen the night of August 15 while on his way home. He was felled to the ground by a powerful blow from behind. Though stunned he managed to defend himself, and finally scared his assailants away by threatening to shoot. Fortunately his injuries are not serious, though he was in a dazed condition when he reached home.

YOU CAN give the AMERICAN FLORIST your fullest support by confining your orders to those who advertise in its columns, and when ordering mentioning the fact that you were induced to order by the adv. in the FLORIST.

Boston to Toronto.

Two delegations went from Boston to the Toronto meeting, numbering altogether eighty persons. President Norton felt very highly pleased by the compliment which was implied by this big attendance, it being by far the largest number on record as attending a convention from Boston.

The first party started on Saturday evening, Aug. 15, at 7:15 P. M. The Harris Palatial Car had been secured, but the crowd was too large for it and the overflow was provided with accommodations in an extra sleeper. Arrangements had been perfected whereby the delegation could be fed on the car. The unexpected large number in the party seriously interfered with the satisfactory carrying out of this part of the program, but the inconvenience thus caused was shared alike by everybody and the unavoidable discomforts were borne good-naturedly. After supper the piano was opened and singing was in order, "God Save the Queen" and "The Star Spangled Banner" both receiving their share of attention. Miss Hamblett of Nashua furnished the accompaniments on the piano assisted by Warren Ewell, who did lusty service with his harmonica, his cheeks puffing out like two big red apples. Judge Hoitt also furnished his share of accompaniment betimes with a knife and fork and plate, this performance on his part being not only ornamental but useful, as it was intended to announce to the waiter that he was hungry. Mr. Sheppard forgot which berth belonged to him, whereupon he was offered a share in a number of berths already occupied, all of which he refused, although it is difficult to understand how he had the courage to resist such tempting invitations.

Upon arrival at Montreal the party was taken in charge by the brethren in that city and shown the sights of the town, including the cathedral and a drive up the mountain. The visitors were hardly prepared for the magnificent sight which met their gaze after reaching the outlook on the mountain top. No grander sight can be seen in any city on the continent. The whole city and surrounding country appear spread out like a map and the great St. Lawrence river can be seen for many miles. The beauties of that drive and the kind hospitality of the Montreal boys will never be forgotten by those who were so fortunate as to participate on that occasion. Sunday evening the trip was resumed and Toronto reached on Monday morning.

The second delegation started from Boston on Monday morning, due in Toronto Tuesday morning, but alas! while they slept their special car was, through the stupidity of some railroad employe, sidetracked and billed to Ottawa by mistake instead of Toronto, and the blunder not being known till morning, it was after the close of the opening session of the convention when they arrived. A large placard in the exhibition hall announced that the Boston delegation had been "lost, strayed or stolen" and offered a suitable reward for their recovery. The members of the party refused, however, to accept any condolence or sympathy, and claimed to have enjoyed themselves every minute of the time, and when it is remembered that in the number were such worthies as Tom Cox, Elijah Wood, Lucius Foster, D. Zirngiebel and other shining lights it is probable they tell the truth.

The return trip to Boston after the close of the convention was as enjoyable as the outward journey had been. Many of the delegates went their own way, but there were enough leaving together on Friday night to fill a car for Montreal and Boston direct, and one via Ottawa, the latter party wishing to make the trip down the Ottawa river by boat. The only man who objected to being asked inquisitive questions was Robert Blair. Every other man in the party was perfectly willing to give a detailed account of what he had done. On arrival at St. Johnsbury, Mr. Dirwanger changed cars for Portland and was given three rousing cheers, accompanied by the vociferous announcement in song that "he was a jolly good fellow." Stacey at Manchester, Sheppard at Lowell, and Stewart at Winchester all received the same hearty send-off, and at 10 P. M. on Saturday, August 22, the trip was a thing of the past.

W. R. Smith, of Washington, accompanied the Boston delegation, both going and coming. They are his boys, he says.

W. J. S.

The World's Fair.

Last Friday Director-General Davis nominated Mr. John Thorpe for Chief of the Division of Floriculture of the World's Columbian Exposition. The appointment will unquestionably be confirmed as soon as the Directory and Board of Control meet. Mr. Thorpe came direct to Chicago from Toronto and the long delayed work of the division will undoubtedly be at once begun. Mr. Thorpe is beyond question the right man in the right place and we may now look forward to a grand display in this division whatever may be the outcome of the contest over the chiefship of the Horticultural Bureau.

The appointment of Mr. J. M. Samuels as Chief of the Bureau is still unconfirmed by the local Directory, no meeting having been held since the one at which the matter was referred to a committee for consideration. Reports as to the conclusions of the members of the committee are conflicting.

WHY You Should Grow Mushrooms.
Because they are the most profitable crop for the outlay that can be grown and may be grown without interfering with other crops. The market is sure, the supply never having been equal to demand.

WHEN You Should Grow Mushrooms.
During the Winter and Spring months, the first planting in August or September with successional planting until April.

WHERE You Should Grow Mushrooms.
Under the greenhouse benches, on the greenhouse benches among growing crops, in Rose Houses, in frames in the greenhouse, in cellars, stables or outhouses, in the open field or in mushroom houses.

HOW You Should Grow Mushrooms.

First get spawn that will grow. It must be fresh, well spawned, and in good condition. **Gardiner's Celebrated English Mushroom Spawn** is the best, and is always fresh and reliable. The details of culture are given concisely in our treatise, **"Mushrooms for the Million,"** Mailed free. **Falconer's "Mushrooms and How to Grow Them."** Published at $1.50. (Gardiner's price $1 35 post free.) **Robinson's "Mushroom Culture,"** 50 cts. postpaid.

GARDINER'S ENGLISH MUSHROOM SPAWN.

John Gardiner & Co., have made a specialty of choice spawn for years, and their celebrated English brand (made by the best maker in England, specially for their trade), has gained an enviable reputation among critical growers for its uniform good quality, and can be thoroughly relied on to produce a good crop of the best mushrooms. Orders booked now for delivery as wanted, $8.00 per 100 lbs. Special rates to large growers. Address all correspondence to **21 North Thirteenth Street,** Philadelphia, Pa.

PAPER BAGS AND ENVELOPES

Special attention given to

Seed Bags and Catalogue Envelopes.

NEW HAVEN, CONN.

Newport, R. I.

At a ball given by Mr. and Mrs. I. Townsend August 17, the floral decorations were exceptionally fine. Palms and flowering plants lined the broad hall to the staircase, which was hung with heavy wreaths of laurel caught with bunches of scarlet gladioli tied with cream satin ribbons. The sitting room was transformed into a conservatory of palms and orchids. The ball room was decorated with cut flowers in panels, fringes and garlands with pendants. The walls were hung with tapestry relieved by bulrushes tied with cardinal ribbons. Oaks inclosed the doorways, vines ran everywhere and golden-rod and wild grasses abounded. Other apartments were decorated with equal elaborateness and originality.

At the ball given by Mr. and Mrs. George Peabody Wetmore on the 18th the floral decorations were also very artistic. The principal decorations were confined to the ball room. From the panels hung garlands and pendants of natural flowers in white and blue, caught up with satin ribbons of a pale pink hue which were tied in long streamers. Combinations of garlands and pendants with the same shade of ribbon hung from two immense mirrors. Pink roses with green, and creamy yellow roses with jessamine were used for these. Vines of passion flowers in bloom were twined about bronze statuary with graceful effect, at the base of which were beds of gloxinias. Allmandas covered the mantel and palms and foliage plants were scattered about through all the rooms. The piazzas and the tent on the lawn presented the appearance of a garden. At one end of the main piazza was a huge tank of lotus and nymphæa plants in full flower. The piazza walls were paneled with wild grasses and bulrushes and oak boughs adorned the ceilings, which were of red and white material. Vines, bamboos, hydrangeas and hollyhocks were used in the tent.

ALBERT BENZ, Douglaston, N. Y.

Philadelphia.

The rubber game of the series of base ball games between the Craigs and the Dreers was played at Riverton on the 15th inst., and resulted in a win for the Craigs by a score of 9 to 3.

W. P. Craig, who did the twirling for his team, did some magnificent work, allowing his opponents only four scattered hits and retiring nine batsmen on strikes. Carr and T. Mullen did some good work with the stick. The Dreers' infield all played good ball, and had many chances offered them to show their mettle which were generally accepted.

THE SCORE:

CRAIGS—	R.	H.	PO.	A.	E.
T. Mullen, c	1	2	9	2	0
Carr, 3b	2	3	0	0	0
P. Mullen, 2b	0	0	2	2	0

THE CHEAPEST AND BEST OF ALL.
FIR-TREE OIL
INSECTICIDE—soluble.

FOR PLANTS.—To make a solution for washing or cleansing purposes—Half-a-Pint of Fir-Tree Oil to ten gallons of water.

For Green and Black Fly, Thrip, American Blight, Wooly Aphis, etc.—Half-a-pint of the Fir-Tree Oil to two or four gallons of water, or two or three tablespoonfuls to the pint.

For Red Spider and Caterpillar—Half-a-pint of the Fir-Tree Oil to two gallons of water, or three tablespoonfuls to the pint.

For Mealy Bug, Brown or White Scale—Half-a-Pint of the Fir-Tree Oil to four or six quarts of water, four to eight tablespoonfuls to the pint.

For Mildew and Blight on Fruit or Foliage—Half-a-Pint of the Fir-Tree Oil to a gallon of water, or six tablespoonfuls to the pint.

Used with warm water it is quicker in its action than when cold is used.

Soft or rain water is necessary, and Applied in Wood, Tin or Pot Vessels.—Galvanized Iron Vessels must not be used.

FOR ANIMALS.—For Skin Diseases and Killing Vermin mix one part of Fir-Tree Oil with three parts of warm water and wet the affected part each day. In some cases it may be used stronger For Ring-worm apply full strength with a brush each day.

FOR BIRDS INFECTED WITH PARASITES.—Put a tablespoonful of Fir-Tree Oil in one quart of warm water and dip the bird in it, taking care that its eyes are protected, hold the bird in one hand for one minute, then dip into clean tepid water; this may be repeated. If necessary a much weaker solution may be used with a spray producer.

Sold in Bottles and Tins.

A. H. HEWS & CO., CAMBRIDGE, MASS.

AHEAD OF EVERYTHING.
We Follow None, Prize or No Prize.
Our latest improvements in machinery produce a Standard Pot which for lightness, smoothness and durability, has never been equaled. Customers buying of us will
SAVE ONE-THIRD IN FREIGHT.
And to prove this, we give below a table showing number in Crate and WEIGHT of same, which speaks for itself:

Size.	No. in Crate.	Weight.
1¾-inch	3,000	250 lbs.
2 "	2,400	250 "
2¼ "	1,750	250 "
2½ "	1,450	250 "
3 "	1,280	350 "
3½ "	800	350 "
4 "	600	350 "

It will be seen at a glance, that our pots are one third lighter than formerly, and yet we claim that owing to the superior quality of our clay and improved machinery, they are stronger than any pot in the market, and we frankly ask you to make the test. ☞ SEND FOR PRICES.

Chicago.

The "World's Fair Floral Co." is the title on a new sign on Milwaukee avenue.

Mr. A. Mailander, the West Madison street florist, was married last week.

John E. Bohan has started in as a wholesale commission dealer in cut flowers.

The Chicago delegation had a very pleasant trip to Toronto, and those in the party couldn't say enough in praise of the way they were entertained while in the city over the line. Among those who accompanied the Chicago party from this point were: Mr. R. J. Mendenhall, wife, and three nieces, Minneapolis; G. J. Braun, Denver; Wm. Clark, Colorado Springs, Colo.; H. W. Buckbee, Rockford, Ill.; Fred. Heinl, Terre Haute, Ind.; Thomas Franks, Champaign, Ill.; Mr. Oestertag and two ladies, St. Louis.

Chicago didn't get within good hailing distance of the cup in the bowling tournament, but it got the first prize for highest individual score, and that's something.

Springfield, Mass.

The Springfield Amateur Horticultural Society will hold their fall exhibition of flowers and fruits September 1 and 2 in Union Armory, Springfield, Mass. The indications are that this will be one of the largest fall exhibits of out-door flowers ever held in this country. A large number of tables and other requisites have been ordered to stage the extra quantity of flowers. The June exhibition was a grand success, the society having added a number of hundred dollars to the treasury. The 750 members are not only hard workers for the society, but are all growers from the modest window garden to the seedsmen with 10 acres now in bloom, and when this large body of flowers is staged it will make a sight worth going miles to see. Any grower in this country is invited to exhibit, sending their flowers by express at the society's expense, also catalogue price lists, cards, etc., will be distributed by the society for exhibitors. HITCHINGS & CO.

ESTABLISHED 1844.

GREENHOUSE HEATING AND VENTILATING,

HORTICULTURAL ARCHITECTURE AND BUILDING.

COMMERCIAL ROSE AND GREENHOUSES, CONSERVATORIES, PALM HOUSES, ETC., CONSTRUCTED WITH POSTS, RAFTERS, PURLINS, GUTTERS, SILLS, COLUMNS AND BRACKETS, ALL OF IRON; AND GLAZING BARS, VENTILATING SASH AND SIDING OF WOOD. ERECTED COMPLETE, OR THE STRUCTURAL IRON WORK SHIPPED READY FOR ERECTION WITH PLANS, DETAILS AND FULL INSTRUCTIONS TO ENABLE LOCAL MECHANICS TO COMPLETE THE SAME. —— IRON BENCH FRAMES FOR SLATE OR WOOD TOPS. ——

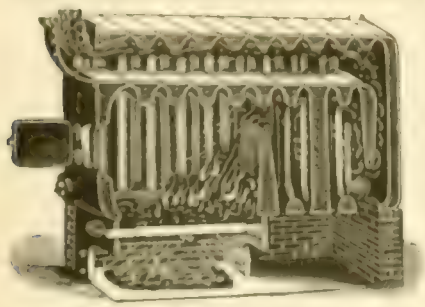
SEND 4 CENTS POSTAGE FOR ILLUSTRATED CATALOGUES.

HITCHINGS & CO., 233 Mercer Street, NEW YORK.

THE EVANS CHALLENGE VENTILATING APPARATUS.

WITHOUT A RIVAL, EITHER IN COST, SPEED IN OPERATION OR SECURITY IN CASE OF STORMS.

— MANUFACTURED BY —



QUAKER CITY MACHINE CO.,

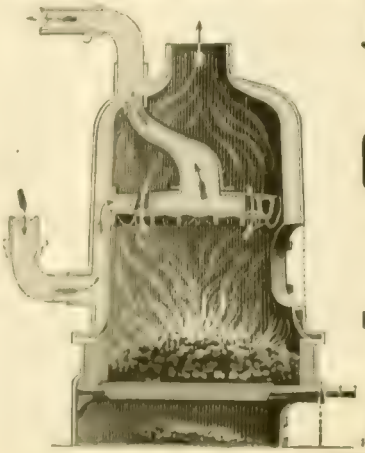
1108 and 1110 North E Street, RICHMOND, IND.

WHEN WRITING FOR ESTIMATES, PLEASE GIVE FOLLOWING DIMENSIONS:

1st. Give the number of sashes to be lifted.
2nd. Give the length and depth of sashes, (depth is down the roof.)
3rd. Give the length of house.
4th. Give the height from the ground to the comb of roof.
5th. Give the thickness and width of rafters or sash bar.

Mention American Florist.

A CARMODY BOILER



will Cost less, Use less Fuel, and has more advantages than any other boiler in the market.

Send for Descriptive Catalogue.

THE National Gardeners' Club of Washington, D. C., has been organized with officers as follows: W. Clarke, president; C. F. Hale, vice-president; Benj. Durfee, treasurer; C. L. Reynolds, corresponding secretary; G. W. Oliver, recording secretary. This organization will attend to the local details of the S. A. F. convention of 1892. They are early in the field and will start the ball rolling now, that they may have a full year in which to elaborate their plans.

New Ideas in Greenhouse Construction and Heating.

BY F. R. PIERSON, TARRYTOWN-ON-HUDSON, N. Y.

[*Read before the Toronto Convention of the Society of American Florists.*]

I do not know as I will advance any new or novel ideas, but in the short time allotted will try and call attention to what I consider some of the most advanced ideas in reference to greenhouse construction and heating. The first thing I consider of importance in the construction of greenhouse buildings in these days of close competition and reduced prices is durability. As to what expense one would be warranted in going to in order to secure such durability would depend largely upon capital available, but where circumstances favor and the necessary amount of capital can be commanded there is no question in my mind that the best houses, in the long run, are the cheapest. Heretofore large profits have induced the cheapest kinds of buildings, the object being to secure the most glass for the least money, many growers saying, I can well afford to tear down and rebuild the house from the additional profits which the increased glass will afford, but with falling markets and decreased revenues, the time is fast approaching when such loose business methods will only result in failure. With capital at 5%, to my mind there is no question but what the best greenhouses that can be built are advisable. In the new houses we have just erected we have used a continuous solid iron rafter, running from the ridge to the ground, set in concrete blocks, which makes probably the most durable construction possible, as the iron rafters being continuous and solid, cannot be affected by decay, and in consequence the roof will remain fixed and rigid, although the sides of the building, which is the part most subject to decay, should become so rotten as to possess little if any strength. What the ribs are to a boat the rafters are to a greenhouse; if any defect in these the house soon requires rebuilding.

Our idea in construction has been to secure practically an indestructible rafter, as we consider the life and strength of the house is dependent upon this. Many are now putting considerable iron in the roof in order to lighten it and secure as much sunlight as possible, as it offers the least obstruction to the rays of the sun, being of less bulk, yet are still using wooden posts and plates. In this combination of wood and iron a large proportion of the expense of the better house is incurred and the particular advantages of the entire iron rafter lost, as such a house is but little better than the regular conventional wooden house so far as strength is concerned, as the weak parts of a house are the sides where the most moisture accumulates and most decay occurs, for no matter how good a roof is, if the posts on which the roof rests become weak through decay, the roof settles, glass breaks and the house soon becomes practically valueless.

Of one thing I am thoroughly satisfied, greenhouse benches should be built entirely of slate and iron, these affording the most desirable materials of which they can be built. Many think that the cost of these preclude their use by the average florist, but I think when the matter is thoroughly looked into, but one conclusion can be arrived at, viz: That there is no question but the use of such benches would show a large profit in every case. There is nothing around a greenhouse which decays so rapidly, requires such large repairs and such frequent renewing as the average bench; so much so that the average life of a greenhouse bench as ordinarily built will hardly exceed five years, and as an average I consider this an outside figure, as when built of the cheapest material, as they usually are, three years sometimes is their life instead of five. Aside from first cost there is one loss occasioned by the frequent renewal of benches, which is very seldom taken into consideration, and that is the loss of a crop or the partial loss of a crop through the time consumed in tearing down the old benches, cleaning the houses and erecting the new ones. Let the florist calculate as closely as he will, more time is consumed in this operation than should be, and the result is the house is planted so much later than it should be, that crops are very often discounted 25% in value, which would pay the entire cost of the best iron benches.

Our system of constructing greenhouse benches we consider superior to anything we have ever seen; whether I can describe our method to make it intelligible in a few words or not is a question. In our iron rafter house a 1¾-inch angle iron is bolted to the perpendicular rafter that forms the side of the house at whatever height the bench is to be built. On this rests the 1½-inch **T** irons, which are used for the cross bearers of the bench, placed every 4 feet apart, the front of the T irons being drilled to receive a bolt to hold the clamp (which is an ordinary cheap casting), which is used as a socket in which the leg of the bench rests, the legs of the bench being made of common 1-inch wrought pipe. The cross bearers are drilled on the upper or T side, front and back, in order to bolt a light 1½-inch angle iron to them drilled every 4 feet to correspond; these angle irons are also drilled on the other side for 1-inch screws, and to these angle irons yellow pine strips 5 inches in width are screwed forming the edges of the bench. The inner and outer angle iron by being bolted to the cross bearers holds the bench together and acts as an outer and inner support for the slate. To support the slate between, two light 1¼-inch T irons are used, which are placed on top the cross bearers lengthwise of the house reversed

and between the angle irons at equal distances. These are not fastened in any way to the bearers, which allows them to take up or give a little in case of variation in the slate. Our benches are exact duplicates of each other in width, being 3 feet, 4 inches in width all over, taking 3 runs of slate 12 inches in width, center beds being twice the width, with a 10-inch walk between. The amount of drilling required to erect such a bench is very slight and can all be done at any machine shop at trifling expense. Everything used in the construction of such a bench are standard materials that can be procured anywhere, and consequently such a bench is within the reach of all. The only special casting required is a clamp to receive the iron pipes used for legs at the front of the bench. We have set the cross bearers in our new houses on the angle iron bolted to the upright iron rafters. Of course this could be modified in old houses or houses constructed differently. With locust posts such an angle iron could be bolted to the locust posts, or the cross bearers could be lengthened out for a brick wall and inserted directly in the wall or a back leg could be used, letting the bench set on two legs, but where it is possible to enter the cross bearers into the brick wall or where it is possible to fasten the angle iron in a durable way to the sides of the house, it cheapens the bench.

One of the most important considerations in a greenhouse is convenience. Everything should be so built that the amount of labor required is reduced to a minimum, as the time is soon to be reached in this business when it will not be a question as to who grows the most stuff, but who can run his place the cheapest that will come out ahead. Everything that conduces to labor saving is a matter of the most vital importance. In our new greenhouses we have carried out a great many ideas, which while not original, embody the most advanced ideas we could glean from our own experience and that of others. Take the question of liquid manure for instance: We have large vats out of doors that can be reached readily by carts, so that the labor in handling the manure is small. The manure is dumped into these vats from dump carts and water pumped by steam through a system of pipes into these vats. This is allowed to soak for 24 hours or more, when the liquid is drawn off into a side vat lower than the first; two valves close the pipes, one leading to the first vat and one from the well from which our water supply is obtained, and the same pipes and the same pump are used to distribute the liquid manure. We have such perfect control of it that we use weak liquid manure regularly once a week and occasionally oftener, and no more time is occupied than would be in watering the place regularly. The amount of labor saved by this arrangement will be best appreciated when we state that four men can now water the place with liquid manure in 2 hours, whereas by using cans it took four men two days to go over the place before our present arrrangements were in operation. The difference in cost between the two methods would make a substantial profit alone in 12 months.

In rose growing a large item of cost is the annual removing and refilling of the soil in which the roses are grown. We use small tram car wheels and dump cars, the sides of the benches being used as tracks. These cars are made large and run through the center of the houses, carrying as much soil as a good stout boy can push—more soil than four boys could carry. When emptying a house several cars are used and two or three men are employed filling the cars. As fast as a car is loaded a boy propels it to the end of the house, where it is dumped into a cart in waiting and brought back; during the time occupied in running down the first car a second is filled up by the same gang of men, which keeps them constantly employed. By the time the second car is filled the first has been emptied and returned, so by the use of two carts to carry the soil away and two or three cars in a house the men are occupied constantly and the greatest economy secured in labor. Our houses are 304 feet in length with doors at either end, which necessitates carrying the soil only 150 feet to the farthest point, and this is rapidly reduced as the houses are emptied. This may not be pertinent to the question I am answering, except in so far as the question of construction would admit of the use of such cars, and for this reason I consider it pertinent.

An idea seldom thought of, but very important, is the location of the walks and purlins with reference one to the other. We use drip bars, which we consider a decided advantage, as they reduce the drip in a house very much, but the question of the location of the purlins with reference to the walks, even with the use of drip bars, is still a matter of vital importance, especially where high grade roses are grown. Drip, in mid-winter on such roses as La France or American Beauty will often destroy flowers worth 50 cents to $1 each. By locating the purlins over the walks almost every bit of drip in the house that would do any damage would be obviated by such location of the purlins; this is possible, as in our new houses none of the purlins are over the benches. Some will say there should be no drip in a properly constructed house, but we find the drip that causes the damage is that produced from condensation from zero and mid-winter weather and not that which comes in from out of doors; that is something that should never occur and never does when a roof is in proper condition, as it should be.

Much has been said and written about overhead heating pipes, but from what we have seen in other places and from our own experience we have nothing to say in favor of this system. In the first place it disfigures the looks of a house, then they are in such a position it is almost impossible to syringe without striking them with water, creating steam, which is a serious disadvantage, as it bleaches high colored roses and tends to soften foliage and is decidedly detrimental to healthy plant growth. Then it is impossible to place the pipes in such position that they will not some time or other be in a position where the plants are likely to strike them, and much damage often ensues. We experimented with them in our old houses when first advocated, but they have all been taken down for reasons just given. We believe the use of overhead mains as commonly used in distributing the steam from the far end of the house does not secure the best results. We have adopted on our place what we consider an original plan for the distribution of steam, and after a year's experience can hardly see how it can be improved. As I have already stated, our houses are 304 feet in length and detached. In order to do away with the necessity of carrying steam the entire length of the houses, 2 houses each 304 feet long are heated in pairs, the boiler room for each range being situated between the two houses and midway from either end. The steam mains and returns are by this plan reduced to a minimum, each being only 58 feet in length; this main is situated in a trench below the walk through the center corridor, which is used as a connection between the separate houses, making access to each house very convenient, the boiler room doors being connected on the corridor. We consider the central location of the boiler rooms a matter of the greatest importance for several reasons: 1st, we have no large mains filled with dead steam, the flow pipe as I said before, being only 58 feet in length, and this controls 600 running feet of house. It must be borne in mind that fires are kept for the greater part of the time in moderate weather and in order to have steam available there must be a pressure on the mains. If but one or two pipes are used in a house long mains are not economical, for no matter how perfectly they may be insulated there is always a large percentage of condensation taking place and that means loss of coal and expense. From the central main pipes are run to either end of the house, returning back on opposite sides of the house, which makes each circuit some 325 feet, which is about as far as steam can be carried to advantage under low pressure. Every pipe throughout its entire length is then a flow pipe and is brought into the return, which is located 3 feet below the flow pipe in the trench beneath the central corridor; the flow and return mains are entirely out of sight and the steam pipes entirely hid under the benches. Every pipe has exactly the same duty to perform and one pipe is the exact counterpart of the other, so that each pipe works exactly the same, each pipe takes steam exactly the same and there is no complication of any kind. No noise is ever heard and steam can be circulated practically with no indicated pressure. A feature of this system is the location of the valves, both the flow and return valves being in the corridor, so that the men in turning on additional pipes are not obliged to travel long lengths of houses if there is a sudden change in the temperature. We consider this system when properly applied and built under the best scientific principles to be the best system of steam heating for the commercial florist of to-day, especially for rose growing as the heat can be controlled at will.

In palm growing, from what experience I have had up to the present time, my preference would be for hot water, as it is necessary in the profitable growing of palms to carry a trifle of heat during the summer and I believe hot water can be run when very little heat is required, cheaper than steam, but in all other cases I give steam the decided preference.

A matter that suggests itself in reference to the subject under consideration is the destruction of green fly. Considerable was said last year about evaporating liquid tobacco. We were decidedly skeptical as to the advisability of evaporating tobacco juice, as we were afraid the moisture generated would tend to bleach American Beauty roses, of which we are very large growers, and for that reason we experimented with it some time before adopting it generally. Our experiments were satisfactory and we fitted our whole place with pans for the evaporation of the tobacco juice, and after one year's experience we can recommend it thoroughly. Galvanized iron troughs about 3 feet in length and 4 inches in width and depth were fitted to the steam pipes, the

JAMES DEAN.

steam pipes running through the troughs. By letting the steam pipes run through the troughs close to the bottom the liquid is evaporated very much more quickly than if the trough was placed on the pipe, evaporating in about two hours. This should be used more as a preventive than a cure, for if the house was badly infested with green fly it would take some time to remove them, but used constantly and regularly no green fly will appear. We have saved hundreds of dollars by the use of this simple remedy and have demonstrated entirely its desirability beyond all question.

We consider it a great advantage to take the chill from water before using for watering in mid-winter. In watering we use a steam pump to pump the water and the plan we use in tempering the water we think is as good as can be devised where steam power is used. The distribution pipe after it leaves the pump is thrown into an ordinary galvanized hot water boiler, such as is used in kitchens, entering at the bottom, the outlet being at the top. Through the center of this heater or boiler a coil of 1¼-inch pipe has been introduced, containing about 50 to 60 feet. The exhaust steam from the pump is thrown into this coil and in passing through it completely condenses, heating the water to a temperature of about 55 or 60 degrees in the coldest weather, which is about the normal temperature of the houses. The advantage of this scheme lies in the fact that exhaust steam is absolute waste and the lost heat is thus utilized. It is a very practical adaptation from this fact that there is no exhaust steam unless the pump is going and then the water is circulating, the two conditions being inseparable. This will be of very little value except to a limited number, but where the conditions exist it is a very satisfactory and cheap arrangement. The danger in putting steam pipes through the heater would be that when the water had stopped passing through the heater it would soon become so hot as to incur danger in its use, as it would soon be raised to boiling point; it would not be as economical either as our plan, where nothing but lost steam is utilized to heat with. It is very difficult in the limited time permitted in a paper of this character to treat such a subject as this at all satisfactorily or thoroughly. I hope that the few ideas here given however may be of interest to some.

James Dean.

The portrait we present in this number is a very good likeness of the newly-elected president of the Society of American Florists, James Dean, of Bay Ridge, New York.

He was born in Scotland and came with his father (who had been gardener for the Marquis of Queensberry, Kinmont Castle, Dumfriesshire) to this country in 1850, when about 5 years of age. His father became gardener on a private place in Astoria, N. Y.; it was here that the subject of this sketch, after receiving a common school education, began his connection with gardening as assistant to his father, until the war between the North and South was declared. He entered the army in 1861, in the 72d New York Volunteers, and served his country as a soldier until the close of the war in 1865; he entered as a private and came home as lieutenant in command of company B, being wounded twice in the course of his service. He was an enthusiastic soldier and still retains an active connection with the Grand Army of the Republic; was in 1890 commander of U. S. Grant Post, Brooklyn, which brought Gen. Grant's body from Mt. McGregor to Riverside.

Shortly after the close of the war he secured employment with Wm. C. Wilson, florist, Astoria, L. I., remaining with him for about two years, leaving to take charge of the garden and grounds of W. C. Langley, Bay Ridge, L. I., which was at that time one of the finest private places in that section. He remained there until about 1875, when he entered into partnership in the florist business with J. M. Keller at Bay Ridge. The firm was very successful, until it was dissolved in 1880, Mr. Dean then beginning business for himself at a short distance from the old place.

He has always been known as one of the very best growers in the vicinity of New York, his great specialties being azaleas, lilies, hydrangeas, cytisus and other Easter plants. His paper on Easter Plants, read before the convention in Boston, will be remembered as one of the most practical and valuable ever read before the society. He has always made a success of every important work he has undertaken and his many friends in the society have entire faith in his ability and fitness for his new position. He is a man of sterling integrity, whose word is as good as his bond, and his genial qualities have endeared him to all who have had opportunity of becoming acquainted with him.

Aquatics.

BY BENJ. GREY, MALDEN, MASS.

[*Read before the Toronto Convention of the Society of American Florists.*]

This subject has been so little written up by cultivators of the present day that I do not propose to attempt to treat it fully in a short paper, such as this, but simply to touch upon points of interest and methods of cultivation, which I hope may prove worthy of the attention of those now cultivating or intending to cultivate this beautiful class of plants, which deserves and no doubt will receive, in consideration of their past increase in public favor, more attention in the near future from commercial growers.

Fifty years ago a few of the leading English gardeners successfully grew nymphæas and other aquatic plants, and their cultivation was quite a feature at some of the finest places of that time, notably that of the Duke of Devonshire, where originated that superb variety Devon-

iana. The distribution of thousands of plants annually is a feature of the present day, and one which from present indications is certain to become much more important in the near future.

A few years ago many supposed that the flowers were artificially colored and were subjected to some chemical treatment to produce the different shades; now the blooms are generally admired and are sold by the leading flower stores as cut flowers, and are also used in designs and bunches on various occasions, thousands being used for these purposes.

From their historic associations the nymphæa and nelumbium have long been of much interest. Nymphæa lotus and Nymphæa cærulea were both figured on Egyptian monuments, also Nelumbium speciosum, representations of which are found on the ruins of the ancient temples. From this evidence the Egyptians were undoubtedly acquainted with it, although the plant no longer abounds in an uncultivated state in Egypt and is supposed to have been originally introduced from Asia, where it is still found plentifully in many parts.

Some confusion exists in regard to the name lotus. According to the best authorities, Nymphæa lotus is probably the true Egyptian lotus, or lotus of the Nile of the ancients and was held sacred to the god Isis, and was engraven on some of their very ancient coins. This, however, is not to be confounded with the lotus of the lotus eaters, which was a tree (Zizyphus lotus) found growing in northern Africa and bearing a sweet fruit. Nelumbium speciosum is the sacred lotus, or water bean, of India. Nymphæa cærulea is called the blue lotus of the Nile, but is also found at the Cape of Good Hope.

The introduction by several of our large cities of water plants into their public parks has done much to educate the public taste for aquatics, and in these places of easy access are admired by thousands.

The introduction of water affords one of the most effective features in landscape gardening, and when judiciously planted becomes doubly pleasing. Many estates contain low, outlying pieces of ground, half neglected, which by the introduction of water gardening might be made the most attractive of spots. If no natural body of water exists a cemented basin of any shape or extent might be made at a comparatively slight expense and planted with aquatics; the background and margins with cannas, cyperus, caladiums, Arundo donax, callas, irises, and other moisture loving plants, making a most pleasing and attractive garden. Any low piece of meadow with a clayey subsoil, and which could be inundated, if broken up and well enriched, might be planted with hardy lilies, with Villarsia nymphæoides, aponogetons and other small growing aquatics for the shallow parts, and would make a most satisfactory lily garden. The nymphæas best suited for this purpose would be: odorata and varieties, yellow and pink; alba candidissimum; chromatella, fine yellow; and for a blue N. scutifolia would probably prove hardy except for very far north. The nelumbiums should also be given a chance, for while the tubers will not stand freezing, yet if planted so that the runners could bury below frost line, they will generally stand over. The calla of the greenhouse will also winter out if planted deep enough, and would be very effective with its fine blooms. Sagittarias, nuphars, orontium, Pontederia cordata, Sabbatia chloroides and a host of native aquatic and bog plants could be added from time to time, which would make such a garden of much interest to botanists as well as mere lovers of the beautiful.

Many have no doubt hesitated about beginning the cultivation of water plants under the impression that the possession of natural ponds or the large outlay of money in preparation were necessary. To such I would say that a few tubs set in a sunny, sheltered spot, with other plants set about them, and planted with nelumbiums and tender nymphæas, would give an opportunity for their successful cultivation. The tropical kinds flower more freely than the hardy ones, as a rule, and being in tubs might be removed to a warm cellar to winter.

The compost best suited for growing them in tubs or pots is good, strong loam and well rotted stable manure, about equal parts. With the proper conditions at first supplied their after requirements are few, and these readily suggest themselves. And in making additions to the collection and with the opportunity afforded by experimenting in hybridization and the raising of new sorts, the cultivator, when once launched, will find a field of never failing interest and enjoyment.

WILLIAM R SMITH.

William R. Smith.

We have pleasure in presenting herewith a portrait of Mr. Wm. R. Smith, the newly elected vice-president of the Society of American Florists.

Mr. Smith is superintendent of the Botanical Gardens at Washington, which position he has held for a quarter of a century or more. He is a recognized authority upon botanical and horticultural matters, and in some classes of plants he cannot be excelled, often determining species that can not be determined at Kew, especially in agaves, yuccas and carnivorous plants.

He has done splendid missionary work for the trade through the distribution of new or little known plants of value to the commercial florist, and has started many an amateur on the way toward making a collection of value. He is of a very kindly nature, always ready to impart information, and the information given can always be depended upon as accurate, for he gives it only when thoroughly assured of its correctness. He has been an enthusiastic supporter of the Society of American Florists ever since its inception and has done much valuable work for its advancement, in a quiet, unostentatious way.

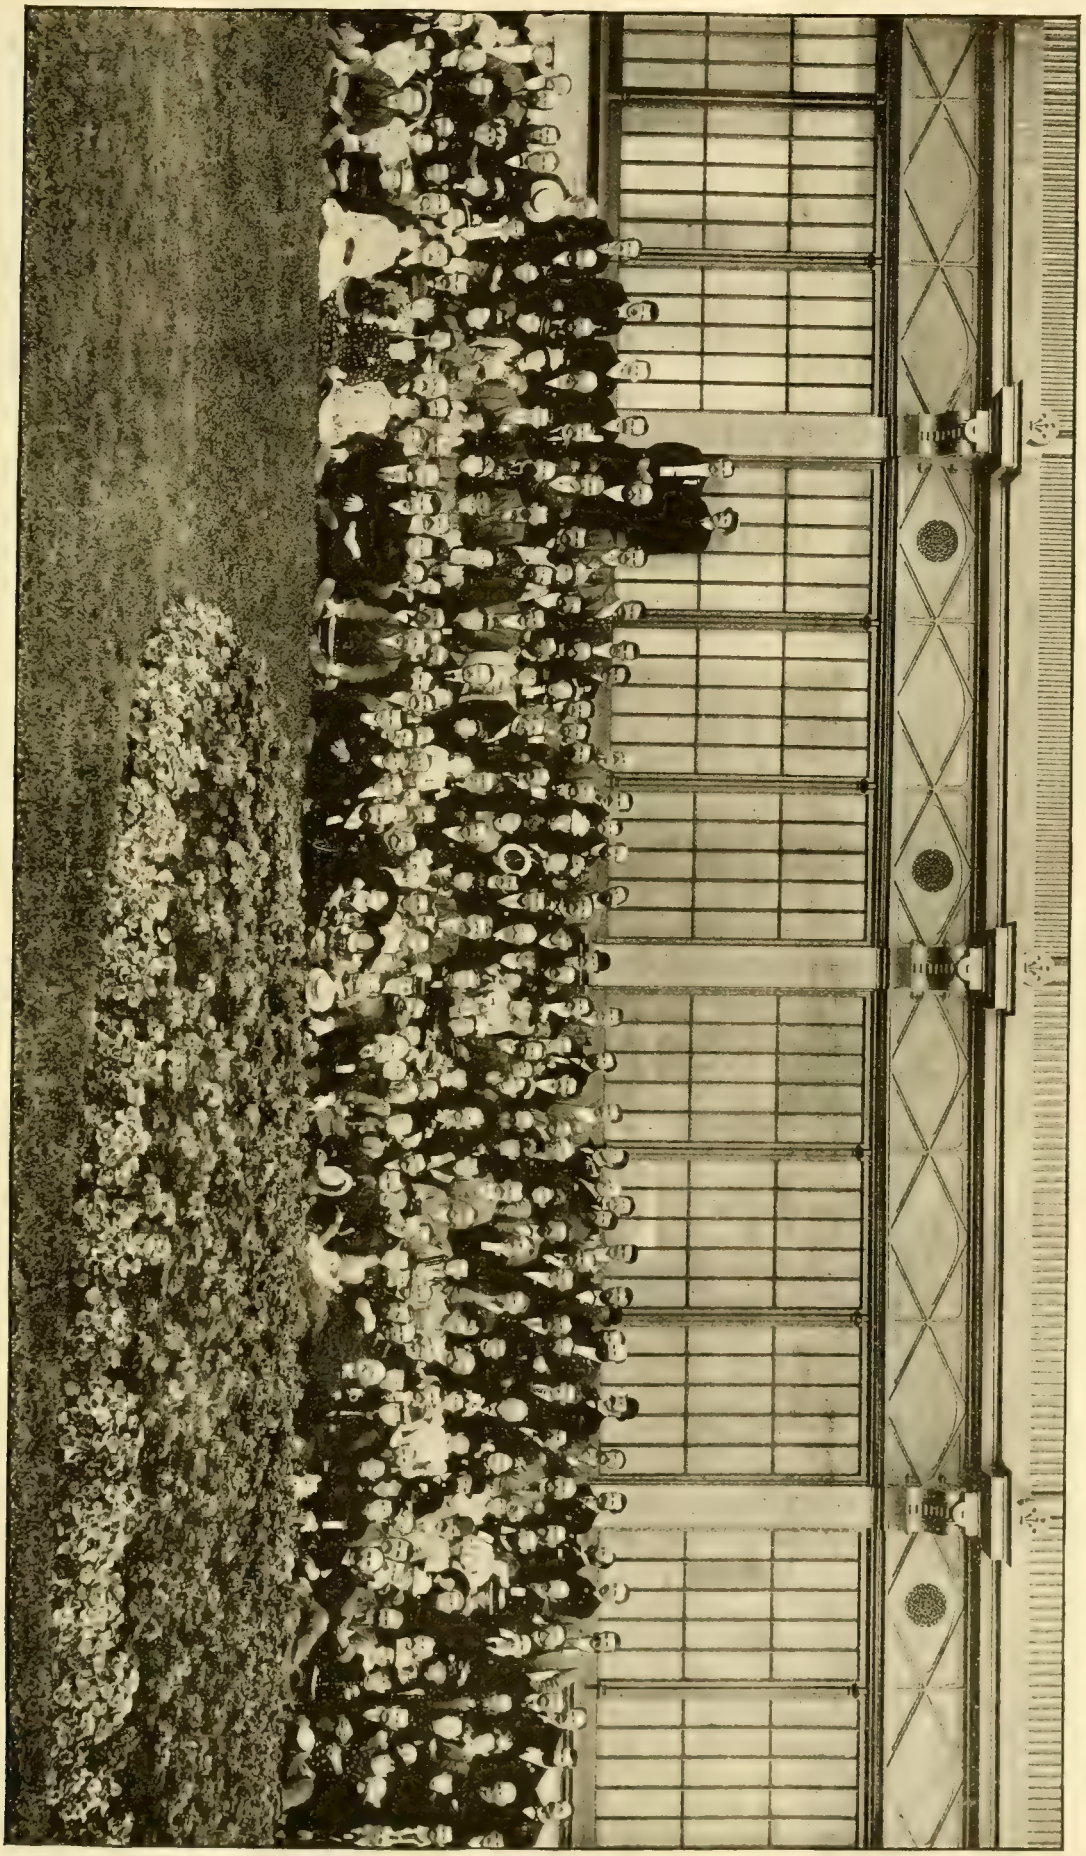
Mr. Smith graduated from Kew with the renowned Wm. Hooker. He was born in Scotland, and his love for the land of his birth is strong. He has one of the most valuable private Burns libraries in the world.

The S. A. F. at Exhibition Park, Toronto.

We present herewith a full page illustration, engraved from the photograph taken at Exhibition Park, Toronto, August 21. The group unfortunately did not include all present at the convention, quite a number having already left for the afternoon trains before the photograph was taken, but as can be seen a goodly crowd was still there. The background is the wall of the main exhibition building at the park.

Credits.

BY H. B. BEATTY, OIL CITY, PA.



[*Read before the Toronto Convention of the Society of American Florists.*]

In assigning to me a paper on credits, your executive committee has given me a subject that I greatly fear we will find is too vast for the limits of an essay. And when I received the notification that I was requested to write on the subject, I at once wrote to Secretary Stewart, asking him if the committee had not indicated what phase of the question they wished me to write on. I received a very prompt reply saying they had not and so I was left to struggle as best I could with the subject.

In what I have to say to-day I will confine myself entirely to some points which I think all business men should ascertain before extending credit to applicants, and leave all theories in regard to the benefits and abuses of the credit system for the question box.

That the subject of credits is a very important one will be admitted by all, and that it seems to be one that requires more attention and thought than it receives is fully attested by the daily list of business failures. It is a subject of special importance to the growers of cut flowers and plants, for, owing to the perishable character of his commodity, he is specially liable to the machinations of the rascal who early realized that, as an immediate sale of the grower's stock must be made or the stock become a total loss, the buyer might, and often does, escape very serious scrutiny as to his ability to pay for what he buys. Then again, usually the stock sold to retail florists is perishable, and consequently if not sold at once is a dead loss to the retailer and also there is nothing the grower or jobber can attach in case of a failure on the part of the retail man to meet his obligations, except a small stock of baskets, designs, and fixtures, and therefore the grower or jobber should be even more careful in regard to credits than the ordinary trader is or should be.

But whom to trust and whom not to is the all-important question, and what rules, if any, can be laid down for our guidance. No "cast iron" rules can be made, as some parties under precisely the same circumstances could be safely trusted, while it would be financial suicide to trust others. I think it desirable and necessary to get reports on all applicants for credit, and to especially get and scru-

THE SOCIETY OF AMERICAN FLORISTS AT EXHIBITION PARK, TORONTO, ONTARIO, AUGUST 21, 1891

tinize closely all information obtainable on the following points:

LOCALITY.—The location of the business need not interest us so much as it might other branches of trade, for most of the buyers of our products and supplies are located in the larger cities; but I think it well for us to look somewhat as to locality, especially if the new applicant is just starting in business. Look with disfavor on any order you may receive from a point that in the usual course of trade could be filled to better advantage from some nearer place. Nine times out of ten you will find the applicant has exhausted his credit nearer home, and is looking for pastures new and fresh. Of course, if you are dealing in a specialty or something none other has this would not apply.

COMPETITION.—Look well to the amount of competition your creditor has to contend against, for on that depends to a great extent his ability to pay you. If he has not much competition it stands that he will in all probability be able to meet his obligations promptly, but if the business in his particular locality is greatly overdone, then look closely to your accounts, for while we say "Competition is the life of trade," it, if overdone, cannot be said to be the life of credits.

AGE.—I think a would-be debtor's age should be carefully considered, for the following reasons: A very young man's efforts are more than likely to be misdirected, and if he makes a failure he is very likely to "give up the ship" and drift into something else and be lost sight of; on the other hand, an old man has not the energy to combat his younger competitors, and especially so if he should be starting in a new line of business. If an old man has been raised in the business he stands a very good chance of making a success of it, but I would advise in considering "Credits" that a middle-aged man of experience, other things being equal, would be the safest to trust. If an old man fails there is not much chance of his ever getting on his feet again, while with the middle-aged there is always a fair chance of his making and paying any old accounts that may be standing against him.

EXPERIENCE.—In every business there are ups and downs that experience alone teaches us how to meet, and usually when we may expect them and also to be in some way prepared to meet and conquer them when they do come. The inexperienced man cannot foresee them, and is very apt when they do come to magnify their import and terrors and usually fails, where an experienced man can safely tide over the "bad times" and knows how to husband his resources in "good times," and so be prepared for the "rainy day" which he knows is sure to come. It is scarcely necessary to say that a man's experience should be carefully considered in extending "credit."

CHARACTER AND HABITS.—This is the most important point on which we can get information, for ability, experience, or even capital would hardly compensate for the lack of good character. In the case of the average capital of a man in business ($1,000 to $5,000) it is the man's honor more than his capital that we have to rely on for our payment, and so too much stress cannot be laid on the point of character and habits. Look to that part of your report closely.

MARRIED OR SINGLE.—It may seem a strange question to ask of an applicant for credit whether he is married or single, but we all know that if a man comes to us for employment that about the first question we will ask him is, "Are you married?" and the married man will usually get the preference for a number of reasons, among which are these: Having a family, we look on him as more stable, more jealous of his honor, as any action reflecting on his honor or integrity injures his loved ones. Then again, he is removed from some temptations that a single man has, and also, having others beside himself to provide for he will be more diligent and attentive to business.

HONESTY.—"Honesty is the best policy" has been written over and over again by us all, and sounded into the ears of the rising generation from time immemorial, but still some people will not be honest. As it is almost impossible to protect yourself against a dishonest man, if your applicant for credit cannot show a clean record as to honesty, have nothing to do with him.

ECONOMY.—We all know that people will buy more if it can be had on credit than if they have to pay cash for it, and as a dealer not only has all his own money at hand, but also his merchandise bought on credit, to do with as he pleases, it behooves us to know whether an applicant for credit is economical or not, as on that point depends to a great extent his ultimate success and ability to pay his bills. If you find his personal and business habits expensive, go slow in extending him credit.

CAPITAL.—This might seem to be the first consideration in considering an applicant for credit, but while very important it is not the most so. You will find as business is now conducted that no house confines its business to its cash capital, but uses instead confidence, and confidence of a community or business associates is frequently almost as good as money. If a man by some dishonest or strange action has forfeited the confidence of the community in which he does business, a greater part of his resources are crippled and his chances of success are very greatly lessened

The limits of this paper will only permit me to briefly mention other points that should be carefully considered in extending "credit." Business education; old record, if any—look carefully to that and also to a man's antecedents; assets, such as stock and personal property, accounts and bills receivable and real estate; liabilities; volume of business; punctuality; chattel mortgages and other liens; insurance; limit of credit.

Awards on Trade Exhibits at Toronto.

The committee on bulbs and seeds awarded honorable mention to H. A. Dreer, Philadelphia, Pitcher & Manda, Short Hills, N. J., and J. C. Vaughan, Chicago, for displays of bulbs.

The committee on cut flowers awarded certificates of merit to H. A. Dreer, Philadelphia, for collection of petunias; to C. H. Allen, Floral Park, N. Y., for collection of gladioli; to Fred Mitchell, Innerkip, Ont., for collection of tuberous rooted begonias; and to W. H. Elliott, Brighton, Mass., for Asparagus plumosa. Also special mention to H. A. Dreer, Philadelphia, for cannas, and to Wm. Tricker, Dongan Hills, N. Y., for water lilies.

The committee on florists' supplies awarded a certificate of merit to W. P. Wight, Madison, N. J., for a growers' cut flower shipping box, and honorable mention to H. Bayersdorfer & Co., Philadelphia, for best exhibit of florists' supplies; to D. B. Long, Buffalo, N. Y., for floral photographs; to N. Steffens, New York, for wire goods; to J. A. Simmers, Toronto, Ont., for miscellaneous florists' supplies; to J. C. Vaughan, Chicago, for miscellaneous florists' supplies; to W. C. Krick, Brooklyn, N. Y., for display of immortelle letters; to H. A. Bunyard, Short Hills, N. J., for chrysanthemum cut flower exhibitor.

The committee on plants awarded certificates of merit to Pitcher & Manda, Short Hills, N. J., for collection of orchids; to same, for stove and greenhouse plants; to same, for specimen of Pteris Victoriæ; to Manton Bros., Toronto, Ont., for specimen Pteris Hallamii; to H. A. Dreer, Philadelphia, for collection of palms and ferns. Honorable mention was given to Cottrell Bros., Toronto, Ont., for ornamental plants; and to Robert Craig, Philadelphia, for palms and other decorative plants.

The committee on boilers and greenhouse construction awarded a certificate of merit to W. P. Wight, Madison, N. J., for a bench tile, to take the place of boards or slates in the bottom of greenhouse benches. They made no other awards, but enumerated apparent points of excellence in several of the articles shown. Following is the remainder of their report:

"Herendeen M'f'g Co., exhibits one large brick set Furman boiler, one smaller surface burning boiler, both for hot water. The vertical circulation of the water and manner of the circulation of the draft through the back tubes as it enters the chimney, points to great economy of fuel. E. C. Gurney Co., exhibit hot water heaters. They are strong, compact and easy in construction, easy to clean. Good circulation is secured by three water columns. Arrangement of heating surface is very good. Edw. W. Holt, exhibits rubber hose of different sizes, armored and plain; also rubber aprons, etc. These goods could only be judged by actual use. E. Hippard, exhibits model of ventilating apparatus, applied in three ways, outside, inside and side ventilating. Operating wheel can be adjusted to any angle, quick and even in operation and not liable to accident. Quaker City Machine Co., exhibits ventilating apparatus, easy of action and simple in construction. The iron work is well finished. The mode of fastening wheel to the shaft is the best we have seen. Davis & Son, exhibit a large variety of flower pots, seed pans and vases, apparently hard and strongly made, though of light color. Geo. Plant makes a creditable exhibit, including standard pots very nearly correct in size; also well finished hand-made pots and vases of large size. A. H. Hews & Co.'s exhibit of flower pots did not arrive in time for exhibition. Lockland Lumber Co. make an exhibit of a section of greenhouse and samples of sash bars. Equally as good as exhibited by this company before. Warden King & Sons exhibited one Spence water heater, strong and simple in construction and easy to keep clean. Detroit Flower Pot Manufactory exhibits samples of standard pots that are well made and correct in measurements. Essex Heights Floral Co. exhibit double jointed galvanized steel glazing points, strong and easily applied, there being no rights and lefts."

An Illustration with a Moral.

The accompanying engraving is from a photograph taken June 13 last and tells plainly a story that every grower should have deeply impressed on his mind. Not only does quality pay, but care in gathering, bunching and marketing is

AN ILLUSTRATION WITH A MORAL.

necessary to secure the best financial returns and without these essentials, previous good quality counts for but little. It is the condition in which the flowers reach the consumer that tells. Whatever they may have been before that counts for nothing if their beauty has afterward been annihilated by improper handling. After you have spared no effort to grow good stuff don't permit careless or inexperienced hands to at one blow destroy the results of previous good work. And under present conditions good quality and careful packing mean something more than a little higher price. They frequently mean a sale at good prices as against an absolute loss when quality and packing are poor. In times of surplus it is the flowers that reach the market in best condition that are sold and it is the poor stuff that is "dumped." And not infrequently flowers of rather inferior quality find a readier sale when well cut and packed than flowers which are better grown but not so well presented to the buyer.

Bedding Coleus.

It is with some trepidation that I venture to write of the coleus, bearing in mind the contemptuous regard bestowed upon it by Bro. McMillan at the Buffalo meeting of the S. A. F. But as many florists continue to use it, while a legion or so of florists' customers are so plebeian in their tastes as to admire it, in spite of Bro. McMillan, I am tempted to brave that gentleman's displeasure and say a word or two about existing varieties, with an eye to greater effectiveness in its use.

Heretofore our choice of really good coleus for bedding purposes has practically been confined to three or four varieties, and probably 80 per cent. of the bedding has been done with crimson Verschaffeltii and Golden Bedder. These are splendid sorts and they will undoubtedly keep their place at or near the head of the list, but they are no longer alone in their eminence. We now have other varieties of equal excellence, widening the range of color, and our coleus beds, instead of being an unvarying blaze of crimson and gold, may almost literally take on the hues of the rainbow.

First among the newer varieties should be placed Golden Verschaffeltii. It is another yellow, but it is one we want. Golden Bedder is far from being a fitting companion to crimson Verschaffeltii, whose vigorous growth often outstrips its hesitating and sometimes erratic mate, and a provoking irregularity of contour results. Golden Verschaffeltii is in every way worthy of its name, and its graceful, clear lemon yellow foliage keeps abreast of the most robust growers. I have it in very effective proximity to Glory of Autumn and Firebrand, and also alongside its crimson namesake. It is *the* yellow of the present as well as of the future. However, it does not take kindly to severe pinching back, and for that reason is difficult to propagate in winter.

Chicago Bedder (why Chicago I don't know) is a coleus which should and will be more widely known than it is. It is the counterpart of Golden Bedder, except in color, which is a clear, solid mahogany red, verging toward terra cotta. Constant in color under all circumstances, healthy and clean in growth, and of compact semi-dwarf habit, it seems to possess the elements of usefulness and popularity. The two "bedders" will match each other as well as the two Verschaffeltiis.

Yeddo is a decided acquisition. The mingling of emerald green and light yellow, shading to white on the edges of the leaves, has a very pleasing effect in mass, while in its habit of growth and immunity from injury by sun or weather it is near perfection. Shelby's Yellow, offered last season, is identical with it, and I have it under still another name.

Glory of Autumn is a grand coleus, useful for any purpose. When fully colored in August and September a bed or a clump or a single plant of it is a striking object.

Crimson Bedder cannot well be excelled for its warm tints and graceful foliage. It is a luxuriant grower, and will overtop Verschaffeltii, from which it differs materially in color.

Firebrand is rapidly growing in favor, and is always reliable. Its dark maroon foliage, with lurid shadings, renders its name very appropriate.

Still darker, even to blackness, is the well-known Hero, which requires some care to make it grow well.

Black Knight is darker still, approaching jet black. More dwarf and every way different from Hero, it is a compact, good grower.

Probably the best green foliaged coleus is Kirkpatrick, but in some situations Peter Henderson affords a better contrast, being lighter in color and more dwarf in growth.

J. Goode, very distinct and fine in growth and habit, fluctuates between green and yellow, but when well colored in a sunny position is very satisfactory.

Henderson's new Silver Leaf is well liked by some growers, but with me it shows very little silver. If it does well on further trial it is certainly a desirable acquisition.

Among the newer fancy sorts are a

number which do well bedded out, and afford novel effects in color. Rob Roy, carmine-scarlet, its crinkled edge penciled yellow, and Bizarre, purplish crimson, bordered dark green, are both excellent; Sunset, a commingling of maroon, carmine and green; Variabilis, combining these and other shades in a very handsome leaf; Sun-ray, a warm shade of crimson with yellow edge; Mrs. Watts, green, yellow and pink ground, thickly spotted with crimson; Fitzpatrick, marbled yellow and crimson, and Spotted Gem, marbled and blotched yellow, black, maroon and crimson, are all fine growers, constant in color and distinct.

Of fifty varieties I have, the twenty above named are all doing well bedded in the ordinary way, but the bedders par excellence are the ten or twelve first named, which certainly afford a very fair range of color contrasts.

ALEX. MCBRIDE.

Alplaus, N. Y., Aug. 25.

Philadelphia.

Toronto is an Indian word and means a place of meeting. It was a very good place To-run-to, and this is how we got there:

At the depot on the morning of the 17th all was bustle and hurry. "Did you get your ticket?" "No." "Well, be sure to ask for certificate." "Did you see John?" "Yes, he was here a minute ago; there he is." "Hello old boy, glad to see you are going!" "Why Dan, thought you said you weren't going." "Why, there's Baker; what a time we will have!"

These and a hundred similar expressions were heard on all sides as the party gathered together. Quite a number of the boys who were not going were on hand to see us of. "Now be sure and bring the cup back with you" came from the bowling contingent. "We will indeed," was the response. "The balls, oh gracious, here Billy, take a hansom and bring three of a size, quick. You've only five minutes." But it was enough, and just as the balls were rolled into the car the train rolled out of the station and the cup was safe.

It was a beautiful day, the fresh country air was delightful, the scenery and ever changing landscapes which were opened up as we sped along never seemed more beautiful.

A Pullman sleeper and combination baggage and passenger car carried us through without change. A great deal of credit is due to Mr. John Westcott for the manner in which he furnished the baggage end of the combination car. A baggage car is seldom a very inviting place, but this time it seemed to be the most popular part of the train. Charlie Kohler had charge, and although he was most generous, it was impossible to exhaust the supply.

Mr. Shroyer and wife joined the party at Lancaster, Mr. McFarland and wife at Harrisburg, Mr. Dillon and wife at Northumberland, and Mr. Harry Chaapel at Williamsport.

The boys were out for a good time and many pranks were played on one another. It really did look as if Baker would not get there alive; it was all Messrs. Weiss and Crawford could do to keep him straight. He got mixed up in a game of euchre at last, but his partner had to give it up. At the same time there was an animated discussion going on in the smoking end of the Pullman, about flushes, straights, full houses, etc., which was very entertaining, and offered much amusement.

The day was passed very pleasantly and about 11 P. M. all turned in for the night. When suspension bridge was reached there was a halt, the custom house officers were not satisfied about some sample plants sent by Mr. H. A. Dreer; after considerable difficulty the matter was adjusted and we passed on to Hamilton, where we lay until morning. At 7:30 we were off again, reaching Toronto after a two hours' ride.

Toronto is a beautiful city. The streets all run at right angles and are very well paved, a great many of them with wooden blocks. These are cross sections of white cedar logs about 6 to 8 inches long and from 6 to 12 inches in diameter and are said to last from 10 to 12 years if properly put down. There is also quite a lot paved with asphalt, which they think very well of. Except in the business portion of the city, the streets are lined with shade trees planted in a sodded border between the sidewalks and roadway. As the streets are all of good width this feature adds to their beauty very materially and this together with the cleanliness which is everywhere apparent makes Toronto one of the handsomest of American cities.

The convention hall was beautifully located and was all that was claimed for it as a place of meeting, there being no rumbling wagons to disturb the proceedings.

The drive about the city, given to the ladies of the society was very much enjoyed. They were shown all places of interest and afterwards partook of a lunch at Island Park, an island in the lake about fifteen minutes' ride by boat. The band of the Queen's Own Rifles was present and rendered some good music.

Wednesday afternoon was spent by all at Alderman Hallam's country seat, Chorley park. It is a new place with very fine natural scenery and after Mr. Hallam's plans are carried out, will no doubt be one of the handsomest private places of the country. A very fine band of music was present and rendered a number of airs, popular with us, which were very much appreciated. Mr. Hallam's daughter, a very bright little girl, recited several selections which delighted all who could get within hearing; the selection, "Finishing the Baby," was very amusing.

On Thursday afternoon the bowling match, one of the events of the week, took place. A great deal of interest was manifested by the various teams and their friends, and at least five clubs felt sure of taking the cup home with them. Of course as only one could have it the only way to get it was to roll for it, and roll they did. Such rolling! There were strikes upon strikes and spares and breaks; every one had a look of determination on his face. Such expressions as "now play carefully, get that spare, you can make it"; "my, wasn't that close"; "good boy, another strike"; "never mind, you made a good try," were heard as the separate teams met with varying success. But when the Philadelphia boys had rolled off their last game and it was found they had made 1848 pins and had tied New York the excitement was at fever heat. It was decided to roll off five more frames, half a game. For the first frame or two it looked doubtful for Philadelphia, but then the boys took a brace and pulled ahead, John Westcott making the splendid total of 110 pins. When the game was finished the score stood 48 pins in Philadelphia's favor. When the result was announced the New York team gave Philadelphia three rousing cheers, which were returned with a good will, and the match was over.

The next day was spent with the Toronto Florists' Club in a sail on the lake for about two hours, when we were taken to the exhibition grounds on the lake front near the city. It is a very pretty place; the bedding is fine and the lawns very well kept. A collation was served in the annex to the main building, which was nicely decorated for the occasion. After feasting on the good things provided we were entertained by some very good speeches, humorous and otherwise, and some good singing; finally all adjourned to the lawn, where a photographer in waiting took a picture of the group, after some difficulty with a dog and a certain Scott. The boat was now taken and in a short time all were back in the city immensely pleased with their trip.

Next morning there was a general exodus, most of the Philadelphia delegation coming home via Niagara Falls and Watkins Glen.

Long live the Toronto Florists' Club and the good people who worked with them to make our visit one long to be remembered. Z.

Boston.

The Toronto delegates returned home to find everything about as they left it, but one unfortunate incident having occurred to break the wonted midsummer stillness of the flower trade in this vicinity. On Thursday, Aug. 20, W. S. McGregor, a well-known grower residing at Woburn, during an altercation on Bosworth street near Horticultural Hall, was stabbed by a man named Daniel Downey. On Saturday, Aug. 29, McGregor died from his injuries at the Mass. General Hospital and his assailant has been held for murder.

The cut flower trade has been unusually dull throughout August. Prices are very low on all grades of flowers. There has been but little demand from sea-side resorts. The asters and gladioluses offered in this market this year are of extra fine quality.

The annual exhibition of plants and flowers of the Massachusetts Horticultural Society was held September 1, 2, 3, and 4, at Horticultural Hall. Both halls were filled with exhibits, and the attendance was large. A full account of the exhibition will be given in our next.

Ernst Asmus and Alex. Burns turned up at the Hub on Sunday morning, August 30, fresh from the fishing ground of Megantic, whither they had gone at the close of the Toronto convention. It was impossible to ascertain from their accounts either the number, size, or age of the fish they had or had not caught.

W. J. S.

THE Toronto Gardeners' and Florists' Club gave the S. A. F. a royal welcome, as everyone who mentioned the subject agreed in saying. There were no unfortunate hitches anywhere, none of the excursions too long or too complicated. In fact, all the entertainment arrangements passed off smoothly, and those who wished to make the afternoon trains were able to do so. It was a wise move that took the society to the province of Ontario.

THE exhibitors at Toronto found themselves somewhat handicapped by the customs affairs, and complained also of the immediate closing of the hall after the sessions, giving them no time for business. There was some justice in these complaints. The space was charged for at

usual prices, displays were delayed at customs, and all business closed during sessions of the society. Nearly all exhibitors unite in claiming to have lost their time, labor and money. Perhaps we must try again the New York plan of holding the exhibition in a separate hall. The S. A. F. must deal justly with every class.

THE Florists' Telegraph Delivery Association was organized at the Toronto meeting. Its object is to maintain a chain of correspondents throughout the world to act together as one concern for the purpose of executing orders transmitted by its members from one city to another. Its officers are C. B. Whitnall, president; H. A. Siebrecht, vice president; H. B. Beatty, secretary and treasurer; directors, W. F. Gale, Frank Huntsman, John Westcott, R. J. Mendenhall, E. S. Nixon, D. B. Long.

News Notes.

SYRACUSE, N. Y.—Albert Burt, the florist, is reported to have returned to this city.

BALTIMORE.—One of the daily papers is agitating the question of a flower market for this city.

ST. PAUL, MINN.—Mr. Cary I. Warren is erecting a number of rose houses at Warrendale. The houses are being built in a very substantial way.

HARRISBURG, PA.—Two wings, each 20x45 feet, are being added to the conservatory in Capitol Park. The additional room was sadly needed.

HARTFORD, CONN.—A special meeting of the Hartford County Hort. Society was held August 26 to make final arrangements for the September exhibition.

LIMA, O.—Swan Bros. are erecting a range of greenhouses here. They will also establish the Ohio Nurseries. Their specialties will be cut flowers and hardy plants.

GALESBURG, ILL.—Mr. Ed. R. Gesler, of the firm of Pillsbury & Gesler, florists, was married August 13 to Miss Lida Winslow, at the home of the bride's parents, Macomb, Ill.

CINCINNATI.—Mr. J. S. Cook is closing up his business as florist and nurseryman with the view to a permanent retirement. He began business here in 1848 and has been in the trade ever since.

QUITMAN, GA.—The recent meeting of the Georgia State Hort. Society was one of the most enjoyable and valuable ever held by the society. Much interest in horticultural matters is being awakened by its work.

NEW BRITAIN, CONN.—The midsummer flower show of the Horticultural Society was very successful, it being the general opinion that it was more interesting and better in every way than any other given by the society.

DETROIT, MICH.—Mr. A. Breitmeyer has retired from business. The establishment that has so long been conducted under the firm name of A. Breitmeyer & Son, will be continued by Mr. A. Breitmeyer's step-sons under the firm name of Rauss Bros.

FOSTORIA, O.—Sacket & North have succeeded E. R. Sackett. The new firm has just completed two new rose houses each 70x20 and a carnation house 150x13, making a total of about 8,000 square feet of glass. The output will be mainly cut flowers.

NEWPORT, R. I.—Klunder & Co., a firm of florists from New York are in trouble. The sheriff paid them a visit August 6 but found nothing to levy upon. All the contents of the store had been removed and no trace of either goods or owners could be found.

CLEVELAND.—A project is on foot to form a horticultural and botanical society, which shall establish a horticultural garden to approximate, if possible, the Shaw Garden in St. Louis. Several representative men who are lovers of flowers are interested in the project.

AURORA, ILL.—An exhibition of chrysanthemums will be held here November 3 and 4 next, under the auspices of one of the local churches. All the florists will participate. Premiums to the amount of $85 are offered in the various classes. Anyone desiring further information may obtain same by addressing Mrs. M. S. Rice, 55 N. Fourth street.

MACON, GA.—Capt. D. B. Woodruff, the florist, has beautified the park in front of the Macon Volunteers' Armory in a novel way. He laid out a hollow plat in the shape of a fort, with hollow bastions at the four corners and with an opening at the lower side. Flowers of various kinds are planted in this plat and a cannon mounted in the hollow square.

SAN FRANCISCO.—At the August meeting of the California State Floral Society the attendance was so large that the capacity of the rooms in which the meeting was held was taxed to the utmost. Ferns and palms were the subjects discussed, and a deep interest was taken by all present. The society is doing much to advance floriculture in this section.

MEADVILLE, PA.—The second Presbyterian Sunday school gave its tenth annual floral exhibition August 20. The display exceeded that of any previous exhibition and was a very gratifying success. Florist August Krueger of this city made an elegant general display and the Oakwood Rose Gardens, Oil City, exhibited a fine collection of cut roses.

INDIANAPOLIS.—Mr. Wm. G. Bertermann has returned from his trip to Europe and reports having had a delightful vacation. A new firm has started into existence, John Rieman & Co., doing a store business only. The florists of this city will probably take a meagre interest in the coming State Fair. A new State Fair Park and better Floral or Horticultural Hall is promised for next season.

SITUATIONS, WANTS, FOR SALE.

Advertisements under this head will be inserted at the rate of 10 cents a line (seven words) each insertion. Cash must accompany order. Plant advs. not admitted under this head.

SITUATION WANTED—By an experienced florist; 30 years' experience. Address
E HAY, 200 N. Green St., Chicago.

SITUATION WANTED—By experienced cut flower grower, commercial or private; first-class references. Address H B, care American Florist.

SITUATION WANTED—By a young man, German, single, 28 years of age, as general greenhouse assistant; good experience. Address
WM. WITTLER, 1310 S 5th St., La Crosse, Wis.

SITUATION WANTED—By a landscape gardener; 25, single; can draw his own plans, or will work as assistant. Has good knowledge of orchids. Address H, care American Florist, Chicago.

SITUATION WANTED—As propagator and grower of roses, rhododendrons, clematis, stove and greenhouse plants. Commercial, or would accept position as second in private place. Address
C M, 208 Dartmouth St, Boston Mass.

SITUATION WANTED—By a first class florist, propagator, landscape, fruit and vegetable gardener; 20 years' experience. References from Fancher Creek Nursery, Fresno, Cal.
HENRY BELLER, 2229 Larimer St, Denver, Colo.

SITUATION WANTED—By an experienced gardener and florist; good grower of roses, carnations, violets and all kinds of greenhouse plants. Good references; English, age 33, married; Commercial or private. Address
J D, 183 Mill St., Poughkeepsie, N. Y.

SITUATION WANTED—As headgardener in private place; 20 years' experience; understands the growing of plants, cut flowers fruits and vegetables. Roses and violets a specialty. Married; age 36; family small. First-class references. Address
GARDENER, box 92, Northport, L. I., N. Y.

SITUATION WANTED—By a good all round man as manager, florist's or private establishment; 25 years practice, private and commercial in England and America. Successful plantsman and cut flower grower; also quick and tasteful at floral work. Abstainer; married, one child. Address
FLORIST, P. O, Victoria, B. C. Canada.

SITUATION WANTED—By gardener of executive ability and experience of all requisites and routine of commercial place, inside and outside operation, general propagation, successful growing of cut flowers, roses, pot plants, accessories to the nurseries, etc. Address
HORTICULTURAL, care American Florist.

SITUATION WANTED—By a first-class florist and gardener; German; 10 years' experience in growing roses, carnations, ferns and all kinds of other plants. Good cut flower worker and decorator. Very industrious; honest; first-class references; as head gardener on private or commercial place. Address G. F. DIEZ, care Schemof & Schubart,
Wheeling West Va.

WANTED—Wholesale catalogues and price lists of plants and florists' supplies.
SWAN BROS., Lima, Ohio.

WANTED—To lease or buy greenhouses, dwelling and land, near good market. Address
H. WISE, Mt. Prospect Ave., Newark, N. J.

WANTED—Three or four hundred feet 4-inch cast pipe; second-hand, in good condition.
LOGANSPORT FLORAL CO., Logansport, Ind.

WANTED—PARTNER—Enterprising young florist wanting to go into business will find out something to his interest by writing to
BOX 65 Kenton Ohio.

WANTED—A thoroughly competent rose grower, capable of managing a large establishment. Apply HORTICOLE,
Grand Central Hotel, New York City.

WANTED—Young man to assist in wholesale cut flower commission store. One who thoroughly understands packing and shipping. Address
M A C, care American Florist, Chicago.

WANTED—Every florist to send for my circular of Little Giant Ventilating Apparatus. See my adv. in convention supplement.
W. H. HUMFELD, 16 E. 7th St., Kansas City, Mo.

WANTED—A foreman who thoroughly understands the propagation and growing of roses and can handle men. Address with references,
ROBERT SCOTT & SON, 19th and Catherine Sts.,
Philadelphia, Pa.

WANTED—A man who has been successful in the management of a first class horticultural establishment, including a knowledge of forestry. Apply HORTICOLE,
Grand Central Hotel, New York City.

WANTED—At St. Augustine, Fla., for 3 months' engagement, commencing January 1, a young woman who is a thorough artist in the arrangement of cut flowers; must be quick and of pleasing address; one from near New York preferred. Address giving age and experience. FLOWER DEPARTMENT OF EL UNICO, Postoffice box 2832, New York City.

FOR SALE—Locomotive steam boiler, 20-horse power. For further particulars, address
JOS. F. SMITH, P. O. Box 140, Burlington, N. J.

FOR RENT—Eight greenhouses, 100 feet each, in good condition; heated by steam. Stock at valuation. Beautiful place and good residence. Address FLORIST, 1216 Euclid Ave., Cleveland, O.

FOR SALE OR RENT—Good frame dwelling and two greenhouses, several thousand pots and good stock of plants, which will be sold at one-half wholesale prices. Rent $10 a month. Would sell at a great bargain. Address
MRS. CHAS. PENRY, Delaware, Ohio.

FOR SALE—Two second-hand Hitchings hot water boilers, No. 18. These have been in use only a short time and for all practical purposes are as good as new. Also 1000 feet of Hitchings 4-inch pipe, together with a quantity of T's, elbows and branches. If you can use all or any part of these, we will make you a very low price for cash. Write us for terms.
C YOUNG & SONS' CO., 1406 Olive St., St. Louis.

NOTICE.

WANTED—A man to propagate and do most any kind of work; also a man to work in the greenhouse and fire a low pressure steam boiler. Address
H. MOORE, 54 Beale St., Memphis, Tenn.

TO LET ON LEASE.

For a term of years, one of the **Largest** and most **Complete** Greenhouse establishments in the **West.** For particulars, apply to
HORTICOLE,
Grand Central Hotel, New York City.

W. C. WILSON, of Astoria, is offering 25 per cent. in final settlement of his affairs, payable 30 days after acceptance.

CHARLEY ANDERSON expects to see sash bars made of aluminum when it gets down to 12 cents per pound.

MR. W. K. HARRIS' apostrophe to the rubber tree was considered a gem.

THE WORLD'S FAIR.

An effort may be made to change the location of the Horticultural Building at the World's Columbian Exposition to a place where the building, or at least the central portion, may remain as a permanent conservatory after the close of the great exposition. The large island in the lagoon has been suggested as an excellent permanent site, and the building could be placed there without necessarily destroying all the trees. The main part of the building could be erected as a permanency and the wings and annexes so built that they could be readily removed after the close of the fair, without in any way injuring the architectural effect of the main part.

It is believed that if the Horticultural Building is to be made a permanency many contributions of immense specimen plants can be secured that would otherwise be withheld, as the owners while willing to send such specimens to form part of a permanent national collection, would be loath to run the risk of their total loss simply for a few months' display. And to such an exhibition would be contributed many large specimens that have outgrown the limits of the conservatories which they at present occupy. In addition to these there will be brought from their habitats specimens of tree ferns, palms, crotons and similar decorative plants of larger size than any ever seen here before—giants such as have never before been in cultivation, and such as no existing conservatory would be large enough to house. All these will be gathered together in the great horticultural building at the Fair and it is of vast importance to horticulture that such a magnificent collection should be made permanent.

Many of the plants that would be contributed to such a collection from public and private conservatories are now historical, and if gathered together in a permanent collection would be a standing national monument of lasting interest and value.

This is a splendid opportunity for the formation of the grandest collection of decorative plants, the finest collection of economic plants, and the most complete assembly of unique specimens in the world, and it should not be permitted to pass unimproved.

We trust that the powers that be will weigh the matter carefully, and if the site already assigned the horticultural building is not eligible for a permanent conservatory, that such change be at once made as to permit the execution of the plan above outlined.

THE question of the real value of the seventh annual meeting as compared with its predecessors is one of interest to friends of the society, especially to those unable to be present. In real worth of papers presented we are sure the coming report will equal, if not exceed, any yet published. The attendance the first two days could not be criticised, but on Thursday everything seemed to go to pieces. It was unfortunate that the bowling contest required so much time. The general impression seems to be that the executive committee must meet some of the difficulties here observed, and prevent their repetition at the next meeting. The question of exhibitors' privileges will have to be met. Considerable complaint was made of the limited time given them.

WE MISSED from the New York delegation F. R. Pierson, John H. Taylor, Julius Roehrs, A. D. Cowan, Wm. Elliott, and other old members.

DIRECTORY.
Every Florist, Nurseryman and Seedsman should have one.
AMERICAN FLORIST CO., Chicago.

The Seed Trade.

AM. SEED TRADE ASSOCIATION.

F. BARTELDES, Lawrence, Kan., president; A. L. DON, New York, secretary and treasurer. The tenth annual meeting at Hartford, Conn., second Tuesday in June, 1892. Applications for membership should be addressed to Wm. Meggatt, chairman membership committee, Wethersfield, Conn.

MR. T. V. W. BERGEN, of the old firm of A. D. Cowan & Co., seedsmen, New York, died August 15, aged 48 years. Mr. Bergen was out with a fishing party Tuesday, August 11, in an open boat and suffered an attack of sunstroke from which he gradually grew worse, and died Saturday night. Mr. Bergen was well known among the Long Island market gardeners, and highly esteemed for his liberality and open-heartedness. He leaves a family consisting of a wife and two daughters, well provided for.

MR. W. ATLEE BURPEE, who has just returned from Europe, reports two new pansies to be introduced soon, one snow white, having instead of the usual yellow eye two smaller petals of pure white; another is a good red, to be called Cardinal.

RUMORS of the organization of a mammoth combination of seedsmen, as proposed last season, are again in circulation, and several firms are said to have placed values on their establishments.

JOHNSON & STOKES are remodeling their office and doubling its size. They are making a specialty of winter seed wheat. Their Dixie watermelon is certainly one of the sweetest.

REPORTS from Philadelphia and vicinity on the onion set crop show present prices, yellows $2.25 to $2.50, whites $2.50 to $2.75. The latter average rather large this year.

NEW YORK.—Weeber & Don, are remodeling their Chambers street store. They have added new seed drawers and repainted inside and out.

MANY of the L. Harrisii bulbs which were packed in cedar sawdust were found to be heated on arrival in New York from Bermuda.

FREDERICK BENTLEY, Tuxedo Park, N. Y., failed the latter part of July.

DUTCH BULBS will be late coming in this season.

M. B. FAXON, of Boston, assigned August 10.

Early Cosmos and Chrysanthemums.

In reply to numerous letters inquiring as to our method of raising early cosmos and chrysanthemums, we give our experience:

Cosmos as a pot plant is a gross feeder, requires large pots, rich compost, sunny exposure, and plenty of water; being naturally brittle, carefully tie and stake the lower branches. In open field we plant cosmos 5 by 6 feet, ours at this time being 6 feet high and covering the ground. This wonderful growth enables us to cut stems any length; large bunches with foliage and buds are of great beauty. Cosmos now ranks next to the chrysanthemum. During the season we ship daily as far as Minnesota. The lasting qualities of this flower make it a great favorite, and it has come to stay.

Early chrysanthemums.—Cuttings from the sand bed are planted in open field early in April; if the season is dry, watering and mulching are necessary, as we must have well grown wood before August; at that time buds appear, if we are to have flowers October 1. Ours show buds as large as peas August 15. Careful disbudding is next in order. If black fleas and bad weather do not interfere we will have creditable flowers of the Chinese varieties October 1. Our local interest in chrysanthemums is not what it ought to be, and were it not for our Northern and Western markets our acreage would be reduced to a fraction. J. L. LOOSE.

Alexandria, Va., August 20.

Correction—Chrysanthemums.

Please correct as follows in the list of new chrysanthemums as published in FLORIST August 20, page 45:

Frank Thomson (not Thompson) (Graham), Flora Hill (Graham).

I have received two letters requesting a correction, which is cheerfully done, one from Mr. Thomas Foulds, late foreman for Mr. Hugh Graham, and the other from Mr. William Graham, Mr. Hugh Graham's son.

It is becoming more and more apparent the necessity of registering new chrysanthemums, both for the purpose of giving credit where it is due and also for chrysanthemum buyers to know where good varieties may be looked for. And last, but by no means least, to avoid the duplication of names. EDWIN LONSDALE.

Heating.

Given a greenhouse with a cold corner, would an open fire place in said corner have any injurious effect on the plants, natural gas being the fuel used? By an open fireplace I mean a grate and chimney such as are used in dwelling houses. M.

EVERYBODY reports chrysanthemum plants as looking well; the fall shows will undoubtedly be larger than ever.

FLORISTS' HAIL ASSOCIATION

SECRETARY'S REPORT.

The amount of glass insured on the first day of August, 1891 was 3,104,583 square feet, of which 1,384,205 square feet was single thick and 1,720 378 square feet was double thick. An extra one-half insurance has been placed upon 18,210 square feet of single thick glass, and 56,251 square feet of double thick glass. An extra whole insurance has been taken upon 155,998 square feet of single thick glass, and 189,835 sq. ft. of double thick glass. The amount received during the year for membership fees was $638.13. The whole amount of advanced assessments received for the year was $960.37. The total amount received during the year for re-insurance of glass broken by hail was $23.98

On the 20th day of September, 1892, the second assessment was levied, 176 members were assessed and all except 17 paid their assessment promptly. Of the 17 whose membership was cancelled seven had either died or retired from business, leaving only ten whose membership was cancelled from causes unknown to the secretary. The total amount received from this assessment was $1,146.24 The amount of the membership fee fund in the hands of the treasurer (after deducting $16.25 which was returned to subscribers to the guarantee fund), is $1,855.84. The total amount of the assessment fund in the hands of the treasurer after paying all losses and expenses for the past year is $1,170.43. The following losses have been paid during the year: To J. J. Schumacher of Sioux Falls, South Dakota, $150 for 3,000 square feet of single thick glass; to S. D. Bradford of Colorado Springs, Colorado, $33.45 for 669 square feet of single thick glass; to B. Jacobs of Canton, Ill., $2.50 for 50 square feet of single thick glass; to Luther Armstrong of Kirkwood, Mo., $27.00 for 540 square feet of single thick glass; to Zeigler Sisters of Junction City, Kan., $5.85 on 117½ square feet of single thick glass; to Margrave & Ward of Hiawatha, Kan., $2.80 for 56 square feet of single thick glass; to Henry Corbett of College Hill, Ohio, $315.30 for 6,506 square feet of single thick glass; to Corbett & Wilson $471.95 for 9,439 square feet of single thick glass; to Herman Bucheler of Oconomowoc, Wis., $81.55 for 1,631 square feet of single thick glass; to Alfred Forder of Cincinnati, Ohio, $86 for 1,720 square feet of single thick glass; to Robert S. Brown & Son of Kansas City, Mo., $13.76 for 250 square feet of single thick and 18 square feet of double thick glass; to J. T. Bartlett of Oconomowoc, Wis., $184.87 for 2,641 square feet of double thick glass; to Mrs. J. E. Patton of Trenton, Mo., $14.40 for 288 square feet of single thick glass; to Herman Schlacter of Winton Place, Ohio, $50.25 for 1,005 square feet of single thick glass, and to E. V. Campbell of St. Cloud, Minn., $5.81 for 116 2 9 square feet of single thick glass.

The percentage of loss for the past year has been one square foot of single thick glass for every 54½ square feet of glass insured, and one square foot of double thick glass for every 647 square feet of glass insured

Hail storms have occurred during the past year at Sioux Falls, South Dakota, Colorado Springs, Colo., Canton, Ill., Westwood, N. J., Nyack, N. Y., Abilene, Kan., St. Louis, Mo., Kirkwood, Mo., Orlando, Fla, Gainesville, Texas, Lake Geneva, Wis, Junction City, Kan., Hiawatha, Kan., Morseley, Mo., Benton, Ill., Kansas City, Mo., Oconomowoc, Wis., Brookfield, Mo., Clyde, Ohio, Winton Place, Ohio, Cincinnati, Ohio, College Hill, Ohio, Hot Springs, South Dakota, Hawthorne, N. J., near Denver, Colo., Audubon county, Iowa, Trenton, Mo., Dillerville, Pa., Cherokee, Iowa, St. Cloud, Minn., and Ardoch, North Dakota. All losses have been promptly paid and satisfactorily adjusted, and the prompt payment of the assessment levied was the final test of the stability of the Florists' Hail Association, and the positive proof that the members were satisfied that the business of the association had been properly conducted by the officers and directors If the success of the association is to be gauged by the extent of the inquiries, the increase of membership will be large during the ensuing year. During the four years and three months of the existence of the association only one assessment has been levied, and of this record I can assure you the officers and directors are justly proud.

JOHN G. ESLER, Secretary.

Germination of Canna Seed.

In preparing canna seed for planting we have a method that we consider much superior to the vise and file.

We take a 3-inch pot with a large drainage hole, cover hole with a piece of wire screen or broken pots, fill three-fourths full of seed, and pour about one-half pint of boiling water over them, and the work is done. Pour the water all on at once, and it runs away before overdoing the matter. If poured slowly it might cook the seed and destroy the germ.

We have practiced this for some time, have never lost any seed, and they germinate at once. The hot water, used as described, breaks the hard shell, but is gone too quickly to injure the germ.

Lincoln, Neb. CHAPIN BROS.

A NEW YORK daily reports that farmers in Florida have begun to raise calla roots for market as a food product. It is also reported that this "new vegetable" is to be introduced to the people of the United States through the Department of Agriculture at Washington. When grown where the ground can be flooded at intervals during the growing season the calla is said to be vastly more prolific than the potato in the production of tubers. Calla lily bulbs are a common vegetable in Japanese markets.

IN the report of the excursion participated in by the Florists' Clubs of Washington and Baltimore, which we copied from the Baltimore *Sun* of July 8 into our issue of July 16, the name of the president of the Washington Club was given as MacEvers. Where the reporter got this name is past finding out, for no man of that name belongs to the club and our old friend, Robert Bowdler, is still the chief executive officer of the Washington Club.

MR. JAMES COLE, lately with Messrs. Standish & Co., Ascot, previously with Messrs. Ireland & Thompson, Edinburgh, has been engaged as manager to the well known firm of Messrs. John Laing & Sons, Forest Hill Nurseries, London, England. Mr. Cole was manager some few years ago to Mr. Such, South Amboy, N. J.

THE Salem, Oregon, *Statesman* tells of a hollyhock grown by an amateur in that city that measured fourteen feet and an inch from the ground to the tip of the stalk. When dealing in such large figures they ought to have "thrown in" the inch for good measure.

THE Montreal *Witness* of August 8 tells us that an amateur of that city succeeded in grafting a morning glory upon a sunflower.

HENRY A. DREER,

Philadelphia

Chicago.

At the meeting of the Florist Club last Thursday evening, three new members were added to the list. They were Messrs. John Thorpe, W. C. Cook, and J. G. Hancock. The question of judging the floral arrangements at the coming exhibition was brought up, and it was expressed as the sense of the club that the plan of selecting the judges from among the lady buyers of flowers, as done last year, be again employed. The place for holding the fall exhibition has not yet been selected. In the consideration of halls for the purpose the new First Regiment Armory was favorably mentioned, and an effort will be made to secure it.

Mr. C. F. Klunder, formerly of New York, is in the city, with the view, it is said, of opening a floral store here.

Never at this time of the year has good stock been so scarce as it is now. The supply is very limited in all kinds of stock, especially in good colored carnations. The demand for these flowers is quite brisk, but scarcely any can be had. Of white the supply is fairly good.

Roses are improving in quality, although the supply is short. American Beauties and La France still head the list for good summer roses. Brides and Mermets are very much improved. Most of the stock that now appears in the market is of good color and free from mildew, although rather small as yet.

Several growers are beginning to cut Wabans. The flowers are small yet, and the stems short, but very fine in color. This rose will undoubtedly prove a good selling variety the coming winter.

PRIMROSES.

The highest improved strains of Chinese Primroses. Twelve distinct colors.

FLOWERS
very large, all fringed and yellow center; bloom on tall stems thrown well above the foliage.

BRILLIANT
colors. Plants vigorous growth; will come into bloom early; now ready for 3-inch pots.

CATALOGUES.

I MAKE 'EM, WITH CUTS AND "KNOW HOW."

J. Horace McFarland,

. HARRISBURG, PA.

A Source of Errors in Nomenclature.

There is a good deal of talk about nomenclature and the intentional changing of the names of plants. I have an idea that I know how some of it occurs. It is through the poor and incorrect writing on plant labels. To prove my theory, I send you half a dozen chrysanthemum labels which I received a few days ago. If you can decipher them without the catalogue of the firm from whom I received them you are smarter than I am.

Oberlin, O. A. R. CONGDON.

[The labels sent were pretty tough. We managed to decipher a few of them—well-known sorts, the names of which are so well known that half the name suggests the rest—but without any knowledge of what the name ought to be we doubt if any living man could have made them out. Certainly every care should be exercised to have the names on labels legibly written. We believe that many of the larger growers use printed labels and this should be done whenever practicable.—ED.]

Mushrooms in a Hurry.

It will be of interest to many lovers of good living to know that an enterprising man uptown has hit upon a plan by means of which anyone can provide himself with a dish of fine, fresh mushrooms at a moment's notice. Those who are accustomed to buying beefsteak garnished with mushrooms freshly gathered from cans at high priced restaurants will thus be enabled to enjoy the esculent morsels within an hour after they have been picked. The ingenious up towner, recognizing the fact that mushrooms lose their original flavor when canned, furnishes a long, narrow box with rich loam and in the center inserts a brick of mushroom spawn. The box is then placed in a cool spot in the cellar, and in twenty-four hours a large crop is ready for picking. A box of this sort filled with spawn, guaranteed to bear fruit for two years, yielding a crop of over 400 fine mushrooms daily, can be bought for $5. The inventor expects to make a permanent industry of mushroom raising in a year or so.

The above clipping is from the Philadelphia *Record*. Philadelphians have been called slow, but that must now be retracted, at least with regard to mushroom growing. Messrs. Robinson's and Falconer's works on mushroom culture would appear to be a long way behind, according to the above.

AHEAD OF EVERYTHING.
We Follow None, Prize or No Prize.
Our latest improvements in machinery produce a Standard Pot which for lightness, smoothness and durability, has never been equaled. Customers buying of us will
SAVE ONE-THIRD IN FREIGHT.
And to prove this, we give below a table showing number in Crate and WEIGHT of same, which speaks for itself:

Size.	No. in Crate.	Weight.
1¾-inch	3,000	250 lbs.
2 "	2,400	250 "
2¼ "	1,750	250 "
2½ "	1,450	250 "
3 "	1,280	350 "
3½ "	800	350 "
4 "	600	350 "

It will be seen at a glance, that our pots are one third lighter than formerly, and yet we claim that owing to the superior quality of our clay and improved machinery, they are stronger than any pot in the market, and we frankly ask you to make the test. ☞ SEND FOR PRICES.

Buffalo.

"Laurence's" (R. F. Laurence, manager) is the sign displayed on a new flower store at 508 Main street, opened last week.

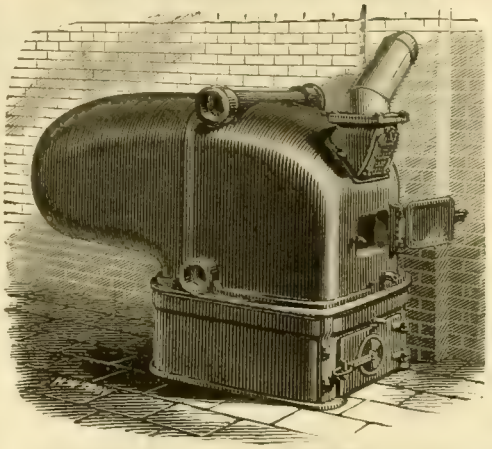
Still another: D. Wood Brant & Co., "druggists, florists and confectioners," all under one roof and starting in at 639 Main street.

All who were at the convention came back well pleased. We didn't expect to win the cup. But look out for the Buffalos' bellow if we don't bring it home with us next year.

Steady rain has made all garden flowers unusually plenty and of high quality. Asters are grand, but go begging for customers.

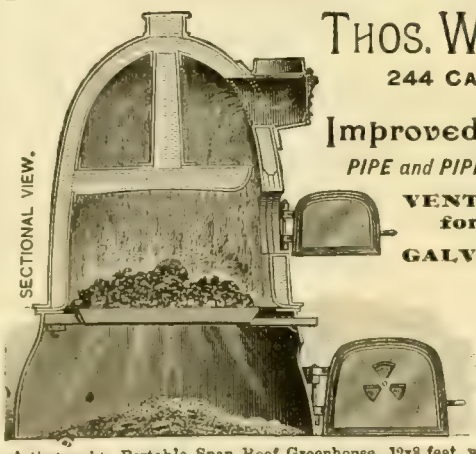
The second base ball game doesn't materialize. The boys generally have had a fill of vacations and every one has returned to active work and business.

Mrs. C. Tyrrell, the lady florist of that western New York hamlet of growers, Corfu, who has been notably successful with carnations, paid us a visit on Saturday.



James Galvin, formerly of Newport, R. I., has taken a store position in Cincinnati with J. A. Peterson. L. B. D.

Profitable Roses.



Mr. F. R. Pierson, of Tarrytown, N. Y., reports the following as the most profitable roses grown by him the past season, in the order named: Souvenir de Wootton, Madame de Watteville, American Beauty.

Copies of the photograph of the S. A. F. in a group at Toronto, the same from which the full page plate in this issue is made, may be had from Mr. J. H. Dunlop, 1 McKenzie Ave., Toronto, Ont., at $1 each.

Propagating the clematis 116

WORLD'S FAIR matters are moving along briskly now. Mr. Thorpe has issued a call for a meeting at Chicago the latter part of this week, of the advisory committee of the S. A. F. appointed at the Toronto convention, to confer with him as to various details connected with the work of the division over which he presides. The exposition committee on grounds and buildings meets on Friday, and the S. A. F. committee will appear before this body and urge the absolute necessity for more outdoor space, that at present allotted being absurdly inadequate.

Boston.

MASS. HORT. SOCIETY.

The annual exhibition of plants and flowers was held at Horticultural Hall on September 1, 2, 3, and 4. This exhibition formerly occurred later in the season, and included fruits and vegetables as well as plants and flowers. But the halls were found to be too small to continue this system if anything like a representative exhibition in either department was to be accommodated.

Another drawback to the old plan was the feeling of uncertainty regarding the weather, with exhibitors having to transport large and valuable stove and greenhouse plants. So the show has been divided, the plant and flower exhibition coming as above and the fruits and vegetables being scheduled for September 15, 16, and 17.

As it proved, the two halls were none too large for the extensive contributions and when everything was in position there was not a square foot of unoccupied space. The unusual demand upon the stock of vases and bottles caused by the very lively competition for the special premiums offered by Peter Henderson & Co., Parker & Wood, and J. C. Vaughan for 100 vases of annuals, 100 vases of asters and 100 vases of dahlias respectively, taxed the resources of the society to the utmost, and it was with difficulty that all were finally accommodated.

The stage in the lower hall presented a beautiful appearance, its whole length in front filled with a most interesting display in vases and dishes, of hardy variegated and ornamental foliage, and backed with a rich group of specimen conifers comprising over fifty species and varieties from the nurseries of W. C. Strong. The vestibules and the front part of the upper hall contained a similar collection of conifers from Temple & Beard, which included many rare kinds and valuable dwarf-growing specimens.

The platform in the upper hall and a section of the floor in front was occupied by a large group of stove and greenhouse plants from Joseph H. White, and both sides of the hall were flanked with similar groups from Frank Becker, N. T. Kidder, G. A. Nickerson, Dr. C. G. Weld, E. W. Gilmore and others.

To Joseph H. White were awarded first premiums for specimen Cycas revoluta and specimen ornamental leaved plant (Coprosma Baueri var.), also second for ornamental leaved plant (Alocasia Macrorhiza var.) and first for specimen adiantum. The adiantums were very fine, particularly a large pot of A. fragrantissima.

G. A. Nickerson's group contained many finely-grown specimens. He received first prizes for six greenhouse and stove plants, six large crotons, and six crotons in 6-inch pots. The crotons were possibly not quite equal in coloring to those shown by this exhibitor on former occasions.

N. T. Kidder, Wm. Martin, gardener, won first prizes for caladiums, ferns, dracænas, lycopods, and ornamental leaved plants, besides quite a number of second premiums. A plant of Croton Hammondii, also the ferns and lycopods in this collection were especially fine. The displays from Dr. C. G. Weld, E. W. Gilmore and Frank Becker comprised a large assortment of ferns, lycopods, dracænas, crotons, etc., to which were awarded a number of premiums.

Frank Becker's araucarias were particularly noticeable for their perfect symmetry, and all his plants were clean and healthy.

E. W. Gilmore received first prize for six orchids. Among the most notable of Mr. Gilmore's plants were a number of pots of Veitch's new hybrid streptocarpus from seed sown last spring, which attracted much attention.

There were some fine specimens of nephrolepis from Clyde Street Greenhouses, and a collection of aquatics from Benj. Grey, comprising twelve new and rare kinds, also from Mr. Grey a group of Canna Star of '91, and three fine cattleyas, one of which was the beautiful white variety of C. Gaskelliana.

To George McWilliam, gardener to Mrs. J. Lasell, was awarded a silver medal for a plant of Alocasia Sanderiana. This plant was the finest thing in the hall, and was an exhibition in itself. Mr. Storer secured a good photograph of it, which will appear later in the AMERICAN FLORIST.

Among the specially notable exhibits was a group of forty new plants never before shown here from Pitcher & Manda, of which the following is a complete list: Cypripedium Josephianum (new hybrid), Druryii x Javanico superbiens, (new hybrid), Spicerianum x Crossianum, Ashburtoniæ majus, C. magniflorum, C. Binoti, Odontoglossum Bictonense album var., Alocasia Chaubieni, A. Count de Kerchove, A. Pucciana, A. Reginæ, Dieffenbachia amoena, D. Memorii Corsi, D. Leopoldii, Pandanus Coricosus, P. Liasianus, P. amaryllidæfolius, Phœnix Roblenii, Philodendron Sodervi, Asparagus commoriensis, A. medius, Areca nobilis, Sonerila aurentalis punctata, Guilulma speciosa, Calamus Noluteamus, Dichorsandra Siebersii, Schismatoglottis pulchra, Dracæna Neo-Caledonica, D. Alsace-Lorraine, D. argentea striata, D. Cantrellii, Aglasnema pictum, Hophlophytum robustum var., Ananassa cochinchinensis, Canistrum Sallieri, Bromelia macrodontes, Pteris Victoriæ, Aspidium amabile, Pteris Wallichiana, Adiantum cuneatum variegatum.

For Pteris Victoriæ was awarded a silver medal and to Alocasia Chaubieni and Dracæna argentea striata, first class certificates of merit.

The most attractive part of the exhibition to the public appeared to be the two enormous tanks of tropical water lilies from Mrs. J. Simpkins of Yarmouthport. These contained a collection of nymphæas, nelumbiums and other aquatic plants, among the best being Nymphæa marliacea chromatella and a fine dark form of N. zanzibarensis. The size of the nymphæa blooms was remarkable, many of them being from ten to twelve inches in diameter. The great Victoria regia was represented by a leaf six feet across and two splendid blooms.

There was also in the lower hall an attractive display of a similar character from J. S. Cowles, gardener to Fairman Rogers, Esq.

It is to be hoped that at some future time the society will provide some more artistic and natural arrangement for aquatic displays than these ungainly square tanks and big tubs. The public interest in aquatic plants is developing fast and an exhibition of them properly displayed with fitting surroundings would be sure to create a sensation.

The display of cut flowers was very extensive. For the silver plate prizes offered by Parker & Wood for one hundred vases of large flowering asters there were seven entries, making seven hundred vases or twenty-one hundred flowers in this class alone. The first prize was awarded to J. H. White and second to R. T. Lombard.

The premiums offered by J. C. Vaughan for fifty vases of large flowering and fifty vases of Lilliputian dahlias drew out some very fine blossoms. W. C. Winter won the former and J. F. Marble the latter. Mr. Marble's lilliputians were equal to the best ever shown here. Rose Buxton took the second Henderson prize for one hundred vases of annuals. The first premium in this class was not awarded.

The society's numerous regular prizes for dahlias were won by W. C. Winter, John Parker and E. Sheppard; for asters in different classes by F. W. Vanderbilt, Mary T. Goddard, J. H. White, Wm. Patterson and others; for Lilium lancifolium by T. C. Thurlow and F. W. Vanderbilt; for tropæolums by Dr. C. G. Weld; for marigolds by F. S. Davis; for flowering cannas by R. and J. Farquhar, J. S. Cowles and Wm. Patterson; for tuberous begonias by W. C. Winter and Seth Rich; for zinnias by Dr. C. G. Weld, F. S. Davis and Mrs. E. M. Gill; for native plants by Mrs. P. D. Richards and I. E. Coburn; and for herbaceous plants by J. W. Manning, Jr., Wm. J. Martin and Temple & Beard.

These three latter exhibitors all deserve special praise for their extensive displays of hardy herbaceous plants throughout the season. Being correctly and legibly named they have been among the most interesting and instructive features of all this season's exhibitions.

From the Harvard Botanic Garden came a large exhibit of hardy herbaceous plants comprising one hundred and ten kinds and of annuals comprising fifty kinds, all named. Among the newer things in this exhibit were Stachys coccinea and the white form of Lobelia syphilitica.

Jackson Dawson showed a collection of fruiting shrubs and heaths, W. C. Strong blooms of Lilium Wallichianum superbum, J. Breck & Sons, Hetherset hybrid gloxinias, and J. Cowles two large vases of Chrysanthemum "Golden Fleece." This chrysanthemum is perfectly hardy at Newport and Mr. Cowles has a large border of it in full bloom at the present time. It is a pompon, bright yellow in color and very floriferous. Its earliness ought to make it an indispensable variety.

The special premiums offered by the Gardeners' and Florists' Club of Boston for mantel decorations did not excite the lively competition which was hoped for. The Boston store florists are something like the famous heathen Chinee, "peculiar." They first announced that they would not compete if David Allan, the winner of the premium last year, was coming in again, an acknowledgement of Davy's formidable abilities, which gratified that gentleman greatly and which he promptly acknowledged by gracefully withdrawing from the lists. To further propitiate these very particular gentlemen it was arranged that the judges for this special department would be selected from out of town to avoid any possible accusations of partiality. But all these inducements were in vain and there were but two competitors, Bowditch & Long and Mrs. E. M. Gill, who won first and second prizes respectively. A photograph of Bowditch & Long's decoration, which was awarded first prize, will appear in a subsequent number of the AMERICAN FLORIST.

The weather during the exhibition was very propitious and the attendance was large. Not many visitors of note came from a distance, the only notable strangers present being Mr. W. A. Manda of Short Hills, N. J., who always comes, and the several gentlemen comprising the Newport contingent. A number of the latter, including Gardiner, Cowles and Gray, piloted by Mr. Flynn of Newton, went to the public garden to view the planting. While there they took a sail in one of the swan boats on the pond, which resulted in a miniature shipwreck on account of an accident to the rudder. But they were heroically rescued by another "gondola" which put out from the shore and towed them safely to dry land, where their friends congratulated them upon their very fortunate escape.

WM. J. STEWART.

Mr. Thorpe Takes Charge.

Last Thursday afternoon the appointment of Mr. John Thorpe as Chief of the Division of Floriculture of the World's Columbian Exposition at Chicago, was formally confirmed by both the bodies which pass upon the appointments of the Director-General, and he then took possession of his office, room 503 in the Rand McNally Building, World's Fair headquarters.

It was felt that the occasion was one that called for some expression of gratification on the part of florists generally, and the officers of the Chicago Florists' Club arranged for a reception at Mr. Thorpe's office, and even with the very limited notice it was possible to give, the room was a bower of flowers sent in by friends and admirers of the new Chief. "The right man in the right place," was the sentiment universally expressed.

A huge basket of roses, in which were hidden three bottles of champagne, came from the Florists' Club of Philadelphia; an elegant basket of orchids came from Pitcher & Manda, Short Hills, N. J., the flowers being arranged after arrival here by Mr. C. F. Klunder, now in the city; a handsome collection of loose orchids was sent by Mr. F. T. McFadden, Cincinnati; baskets of roses by Mr. M. A. Hunt, Terre Haute, Ind., and Mr. E. G. Hill, Richmond, Ind.; L. L. May & Co., St. Paul, sent a large bunch of loose roses; from Mr. Anthony Wiegand and wife, Indianapolis, came a large floral horseshoe; from D. B. Long, Buffalo, a floral tablet bearing the inscription, "Comme il faut"; from H. W. Buckbee, Rockford, Ill., a fine collection of asters; from G. J. Braun, Denver, bouquet of roses. The local florists were represented by a large basket of American Beauty roses from the Chicago Florists' Club, a basket of Duchess of Albany roses from Mr. P. J. Hauswirth, a basket of roses from Mr. F. F. Benthey, a bouquet of roses from Mr. C. F. Klunder, a basket of roses from Mr. C. H. Fisk, a basket of roses and gladioli from Mr. Joseph Curran, a basket of roses from Mr. F. Kennicott, a lot of cut roses from Mr. E. J. Harms, a bunch of roses from Mr. Wm. A. Hanft, a vase of Celosia cristata from Mr. John Lane, and a lot of gladioli from Mr. M. Olsen.

When these were all placed in position on tables, chairs and desks, the room appeared like a good sized section of a flower show, and the people flocked in from all over the great building to see the flowers.

Mr. Thorpe was visibly pleased by the spontaneous exhibition of pleasure at his taking the Chiefship of the Division and accepted congratulations from the callers in his usual pleasant, kindly way.

The department is at last organized, its machinery has begun to move, and under the skillful guiding hand of John Thorpe we may rest assured that Floriculture will be represented at the great exposition in 1893 as it has never before been represented at any previous exposition either at home or abroad. And that he will receive the hearty co-operation and support of every florist in America—and thousands from abroad as well—goes without saying.

Mr. Thorpe has promised to sit for a photograph some time this week, and we hope to be able to present a first-class photo-process portrait in next week's issue.

John M Samuels.

We present herewith an excellent portrait of Mr. John M. Samuels, Chief of the Bureau of Horticulture of the World's Columbian exposition.

Mr. Samuels was born in eastern Kentucky in 1848 and is consequently 43 years of age. In 1852 his father removed to western Kentucky where he engaged in the nursery business which he still conducts, and there the subject of this sketch received his education and assisted his father in his business until he reached his majority. In 1869, when 21 years of age, he established the Louisiana Nurseries at Shreveport, La., which are still in operation. He remained there till 1874 when he returned to Kentucky and secured a half interest in the Mississippi Valley Nurseries, with his father, at Clinton, which interest he still retains. He also invested in land in the states of Mississippi, Tennessee and Florida, upon which he has established orchards of fruits suited to the locality. He cultivated small fruits also, and at one time had a total of 160 acres of strawberries. He has been engaged in horticultural pursuits all his life, mainly in the growing of fruits and nursery stock—both deciduous and citrus fruits, and dealing in same, and in the course of this work has visited every state and territory of the Union with but two exceptions. He has also visited the principal horticultural centers of Europe, and has had opportunity of becoming familiar with the details of nearly every branch of horticulture both at home and abroad.

He was a large exhibitor at the New Orleans World's Exposition, and was awarded 35 premiums and five gold and silver medals.

JOHN M. SAMUELS

Under his leadership we may hope to see the horticultural department at the fair made what it ought to be, a representative exhibit of horticulture as it exists to-day—with every detail given the prominence due it to make a perfect picture of the whole.

Mr. Samuels has assured us that he fully realizes the importance of the Division of Floriculture as a department of his Bureau, and that the Chief of that Division will have his hearty co-operation and warm support in his efforts to give floriculture the prominence it merits. That the Division will be under the direction of Mr. John Thorpe is a sufficient guaranty that nothing that would contribute to its success will be left undone if he be given proper opportunity.

Store Trade.

BY WM. H. LONG, BOSTON, MASS.

[*Read before the Toronto Convention of the Society of American Florists.*]

As in most business enterprises the best results have been achieved through co-operation, there is no room for doubting the benefits to be derived by the votaries of fair Flora in the pursuit of the same course. Since the organization of the Society of American Florists much has been accomplished in the way of healing of differences that existed and would still exist in the trade were it not for the breaking down of the barrier of jealousy that confronted the interest of many who now see a clearer way to success. The manufacturer, the jobber and the trader profit by a close intercourse and understanding regarding their business relations, and there is no reason why the grower, the consignee and the retail florist should not be equally successful through the system of co-operation.

An experience of a quarter of a century has furnished me with material sufficient to draw on and acquaint my younger friends with a brief survey of the retail flower trade during that period.

There are many present who are perhaps not aware of the fact that twenty years ago the great city of New York depended on the city of Boston for its supply of long-stemmed roses, no flower being cut in the neighborhood of the former place with stems more than two inches in length. What changes since then! No place in the country with a population of 5,000 is without its florist. While it is true we have made such wondrous strides in the development of our art, it is equally true that we have allowed our opportunities for pecuniary profit to be materially abridged. When the retail flower trade received its first impetus from 1865 to 1870 flowers were not plenty, but the retailer had an equal chance with his competitor. With much regret it must be admitted that such is not the case to-day, for while the supply has increased one hundred fold, we find an unwarranted discrimination on the part of a few commission men who supply their more fortunate customers with the best, and the less extensive purchaser—even though prompt in his payments—with what may be left. As most of the desirable stock is consigned to wholesalers in large cities, from whom the shop keeper must purchase or go without material for his business, the unfortunate position of the man who purchases lightly must be apparent. Fortunately however the bulk of consigned goods are in the hands of honest and intelligent men, as were they all as those referred to, it would be simply a matter of the rich being made richer and the poor poorer.

While on this subject your attention must be called to another matter of serious importance, one that threatens the retail florist, store trade especially, with sad consequences. I refer to the unhappy method adopted by some growers and wholesalers of furnishing street Arabs with flowers at prices so ruinously low as to enable them to dispose of their goods for one-half and not infrequently one-quarter the price demanded of the retailer. When the nuisance was less prevalent than at present the shopkeeper could impress some customers who inquired "how the boys on the street could se'l for so much less than the store," with the belief that the flowers were stale. Within the past few years we find a different state of affairs, for the very people who a short time ago refused to patronize these pests, are now using their goods and find they are as fresh as those purchased in the stores.

Were these venders required to pay the same prices that the retailer is charged, there would be no cause for complaint, as every living creature is allowed the undeniable right to earn an honest existence, but when the retailer is forced to pay from two to four times as much as the street peddler, he must as a consequence suffer somewhat in his cut flower sales. But the great trouble is not alone the dispensing to them, but by them. There is no doubt that an article may be made popular by being brought in contact with a community, but when that contact is made through the agency of the most depraved and vicious imps to be found in the slums of large cities and who infect the fashionable thoroughfares with their forbidding presence and thrusting bunches of flowers in the faces of ladies, it is time the florist looked well to his laurels, or our calling must soon be brought into contempt.

The question might be asked, "what shall we do with our overstock?" That question I am not prepared to answer just now, but through the agency of this very association means might be adopted for the solution of the abstruse problem. Suffice it to say that all stock in an open market not purchased at a fixed price had better be destroyed than sacrificed to street venders, who stop the sales that would otherwise go to a reputable shopkeeper, the depletion of whose stock signifies the heavier purchasing from the wholesaler at profitable rates, and the latter's opportunity for making better returns to his consignor than would result from the sacrifice offerings of the street vender.

As it is quite well to leave well enough alone, I will not take your time by repeating the pleasant memories in connection with store trade or the tremendous strides made in the advancement of our profession, as they are well understood, but will confine myself to weak spots in the hope that errors may be rectified and the toiler adequately compensated for his labor. By a close observation I have discovered that a majority of the young men and boys in the employ of retail florists are far below the standard in primary education, not being able to convey their thoughts to paper in the simple matter of taking an order from a customer. Mistakes of a serious nature are often the result of this misfortune. Frequently in an effort to decipher these hieroglyphs we find ourselves booked for an order quite at variance with the purchaser's intention. This is to be deplored, as most of the young people referred to are bright, intelligent lads, quite up to the times, many possessing the material for good business men, if only properly cared for. But how are these boys, most of whom through circumstances have been forced to work while at a tender age, to secure the prize they deserve in the way of but a little education, if they are kept at their posts till very late night after night? Without doubt man's avarice is his greatest curse. How many have been brought low through their love of gain, sacrificing health, pleasure and happiness for an extra dollar he cannot use, but which must be left to others to squander. In the hope of making one sale more for the day the avaricious man keeps his place open a simple hour later than his neighbor; his competitor discovers this and remains at business still later, until in the course of time, as is noticeable in New York, the greater number of stores are kept open till very late at night. The folly of this measure must be apparent to all thinking men. No doubt the late hour shopkeeper, if asked why he keeps his place of business open so long, will inform you that he is justified in attending to customers as long as they come in. To this I will answer that during the past twenty-five years I have had occasion from time to time to remain at my place of business all night, preparing orders for the following day, and for every hour of the night I have had customers. Reasoning from this standpoint the tradesman to whom I refer is justified in keeping his place of business open all and every night. Until within a few years the dry goods man would have considered himself on the brink of financial ruin if told he should close his place at six o'clock in the evening, but when the clerks organized and inaugurated the early closing movement the merchant discovered that he could do as much business as formerly in fewer hours and the only loss incurred fell on the gas monopoly, who were no longer required to furnish their long bills for gas light.

As the dry goods man found he could do as well in fewer hours, so can the retail florist. I have yet to be convinced that the flower trade in any part of this country cannot be finished before seven o'clock every evening and his store closed on Sunday.

If an employer would but for a moment consider the situation and give his boys a chance to take advantage of the opportunity afforded by our night schools in securing an education, he would not only benefit himself, but the boy he expects in time to take the reins of his business and manage successfully the affairs of a trade he has worked hard to establish and would no doubt be a pleasure for him to see perpetuated.

The Chrysanthemum Bug.

I thought it might interest your correspondent, Aug. S. S., page 58, and perhaps others, to know that in the combat with the chrysanthemum bug in this district, which is infested more than any other that I know of, the growers after having tried in vain every suggested remedy, have retired from the fight, carrying their plants in with them. Some private collections are fortified between mosquito netting, and those that were protected in this way early in the season are doing admirably.

These pests commence their ravages in June, or before, when large numbers visit the patch and are very busy. What they do there, I have not seen clearly explained, but after two years' careful observation, I find that, 1st, they puncture the young growth, 2nd, that they do not feed on the juices, as the plant does not show any ill effects for some time, and on crushing the insect no difference either in quantity or color of matter is apparent, at the beginning or end of a visit. 3rd, that in a few weeks the plants begin to suffer visibly, long wounds—from the point several inches down in some cases—appear on the young shoots, and the whole plant seems blasted. 4th, in these wounds may be found numbers of very small insects, at first something like yellow thrip, then like very lively greenfly, and later, showing unmistakably what they are.

From all this I gather that the business of the perfect fly is not eating, but egg laying, and from that time the plant is practically ruined; that not eating, they can't very well be poisoned, and being too nimble to be caught, or sprayed on, the only alternative left is to keep them away by some mechanical means.

We grow our plants entirely in pots, in light airy houses, which can be shut up and fumigated upon any appearance of the bug, and that is a very rare occurrence indoors. We are not altogether sorry that the bug came along, as it has driven us to grow our chrysanthemums in this way, for we can get far cleaner and more saleable plants, than by the old method of planting out doors and lifting and potting. P.

Brookline, Mass.

In answer to the inquiry of "Aug. S. S." in No. 168 of the FLORIST as to how to get rid of the chrysanthemum bug, he will find the following a sure and effective remedy: Take 4 pounds of tobacco stems to a pail of soft water, boil it for about one hour, let it cool and strain it through a piece of cotton. If the plants are in pots turn them upside down and dip them into it, or if they are planted out syringe the affected plants with the liquid. One dose will be found enough in ordinary cases. One pail full will clean 500 plants. H. T.

Another Illustration with a Moral.

We present in this issue an illustration that tells more plainly than any written argument why some growers get good prices for their carnations and others but very moderate prices, and also why some growers' stock is sold out clean and that of others is not—when there is more than a full stock in the market. With the present demand for long stem flowers the bunch at the right will find a quick sale over the counter at say 50 cents a dozen, while the bunch at the left will go begging for a customer at half the price readily paid for the others.

Of course the man who cuts the long stems should receive more for his flowers, and he does. But even when the same price is paid, isn't it better to cut long stems and some few buds, than to cut a few more flowers and then have a large share of them go onto the dump heap? To a man up a tree the plan that brings in the most dollars appears to be the most profitable one, regardless of how many flowers it takes to do it. If fewer flowers of better quality will bring in the most money—and that is certainly the way things are going now—then that plan is the best one to pursue. To any skeptics we would recommend a comparative trial. Cut real long stemmed flowers off from half your place, pursue the old plan with the balance, keep your returns separate and size up the results. But pack carefully. Remember that the bunches of very long stem flowers are heavier than the others and they are more liable to be crushed if piled too deep. Never forget that it is the condition in which the flowers reach the buyer that tells, and spare no effort to *preserve* the good quality when once secured.

Aquatics in the West.

The ponds of aquatics in the various Chicago parks have become apparently one of the greatest attractions to visitors and where these beautiful water plants have not yet been tried and room is available, a mistake will be made if they are not introduced. And any florist who has grounds of any extent should not fail to have a pond of these beauties as a summer attraction to those who visit his place.

As most of the cultural directions have so far been given by growers in the east, and as western growers might fear that conditions may vary to such an extent as to make these directions in a measure unreliable for them, we have secured from Superintendent Pettigrew, of Lincoln Park, the following details from his own experience with aquatics at this park.

There are here two ponds, of which one is heated by steam pipes from a power house located near by, and the other is unheated. And it is certainly true that all the tender sorts do vastly better in the heated pond but the unheated pond is no less beautiful in other respects.

Presuming that most of the readers of the FLORIST who might wish to have a pond of aquatic plants would wish to have one in which mainly hardy sorts could be grown, we asked Mr. Pettigrew to give us a list of his strictly hardy sorts first, and here is the list:

Nymphæa marliacea, N. m. rosea, N. m. albida, N. m. carnea, N. m. chromatella, N. alba, N. alba candidissima, N. odorata, N. o. minor, N. o. rosea, N. o. exquisita, N. tuberosa, N. pygmæa. This concludes the list of hardy nymphæas. But all the nelumbiums are hardy, and there are a lot of pretty subjects that can be added to the collection,

ANOTHER ILLUSTRATION WITH A MORAL.

many of them natives, to be used either in the pond or on its margins, that should not be omitted. These are Limnanthemum nymphæoides, Pontederia cordata, Nuphar advena, Saggitaria variabilis, S. v. fl. pl., Caltha palustris, Typha latifolia, (the "cat's-tail"), Zizania aquatica (rice grass), Scirpus Tabernæmontani zebrina (the bullrush), and other forms of same, the potamogeton (pond weed), and for the margin only, Sarracenias Drummondii, rubra, purpurea, and psittacina.

Nymphæa flava (yellow) a native of Florida, has been carried safely through the winter at Lincoln Park without protection, but it is not reliably hardy north of the Ohio river.

In addition to the list of hardy sorts named above there should be added to any pond a few of the following tender ones in order to give a pleasing variety in color, blue, for instance, not appearing in any of the hardy kinds. This color is found in the zanzibarensis group of nymphæas, including N. zanzibarensis, N. z. azurea and N. z. rosea. Then there are Limnocharis Humboldtii (yellow), L. indicum (white), Eichhornia crassipes major (the so-called water orchid or water hyacinth), Saggitaria montevidensis (a very large growing form), and Papyrus antiquorum (the paper reed), Aponogeton distachyon, and Trapa bicornis.

Now we must add some of the night bloomers. These are all tender, but are well worth some extra trouble. They open in the evening, and if the day following be cloudy they may remain open till along in the afternoon, but even if the following day be bright they will remain open until 10 or 11 o'clock in the morning. These are Nymphæas dentata, Devoniensis, and rubra.

Mr. Pettigrew believes that two feet is about the best depth for a pond; the nearer you bring the roots to the sun and light the better the plants will grow and bloom. For a pond in which hardy sorts alone are to be grown possibly a little greater depth might be desirable to keep the roots well below the ice, but for a pond in which many of the tender sorts are to be placed and taken out again in the fall the named depth is about right.

The tender aquatics may all be readily carried over winter in tubs of water in the greenhouse. A single tub of eichhornias will give you stock enough sufficient for a large pond, as they spread rapidly. The tubs may be kept under the greenhouse bench if there is a good light there, but they are well worthy of a place on the bench, and should have it, barring an unusual tight squeeze for room.

N. zanzibarensis varieties should be grown annually from seed. These may be planted any time from August to January. Sow the seed thinly in 4-inch pots or pans about as you sow mignonette, in any sandy soil. Then place the pots in a metallic tank in about a foot of water. There must be a lamp or some other heating arrangement underneath, so that the water can be maintained at a temperature of 80° to 85°. The seeds will germinate in four or five days and as soon as the seedlings can be handled they should be pricked out singly into 2-inch pots, being careful to clean the little plants of any green moss that may have propagated in the tank and attached itself to the seedlings. Place the pots back in the tank or in additional ones and grow on, maintaining the water at the same temperature as before. Pot up as they seem to need it, but probably they will need nothing larger than a 3-inch pot before it is time to plant out in boxes in the ponds. At Lincoln Park the tender aquatics are planted out in the unheated ponds about June 1. In the heated ponds they can be placed out as early as April.

A soil composed of equal parts of turfy loam and cow manure suits all the nymphæas. The nelumbiums love a clayey loam.

Speaking of nymphæas most valuable to the commercial florist, Mr. Pettigrew said that from his experience he believed that Nymphæa marliacea rosea would quickly supersede N. odorata rosea, at least in the west. With him N. marliacea rosea was a much stronger grower and freer bloomer than N. odorata rosea, especially late in the season, and the specimens now to be seen in the ponds certainly bear out his views. He has been told that N. o. rosea does better in the east than it does here, and this may be true, but that N. marliacea rosea is the pink pond lily for the west there can b

little doubt, as the flowers are not only more freely produced, but are also more beautiful than the Cape Cod lily. And Nymphæa marliacea chromatella would appear to be the most valuable yellow sort to the commercial florist. All the marliacea sorts should be annually divided, as otherwise they bunch too much.

On the west side of one of the unheated ponds at Lincoln Park, Mr. Pettigrew has arranged a rocky bank, which, planted as it is with plants and vines, is one of the most charming spots in the park. In among the small rocks grows the brown oxalis, while creeping over all are maurandias, senecios, cobæas, lophospermums, Kenilworth ivy and Solanum jasminoides grandiflorum, the latter at present showing numerous clusters of its strongly fragrant flowers, while dotted here and there waves the Cyperus alternifolius and in the pond below is a colony of cattails and rice grass.

Tamarix amoorensis also grows luxuriantly on the margin of the pond, as does the blue day lily, and Canna Ehemanni is so nearly an aquatic that it can be grown right out in the pond, though it is retained for use on the margins. The two upper ponds are connected by a little strait spanned by a rustic stone bridge, over which clamber a mass of blooming vines. The beautiful picture these ponds present will not be soon forgotten by those privileged to see them.

Plant Notes.

[Apart from the material sent me for my paper on new plants for the convention at Toronto, many items of great interest were contributed by the florists who were so kind as to help me in that matter. The following notes are some of them and given here with the authors' permission.—WM. FALCONER.]

EVERGREENS FOR FLORISTS.—Mr. Joseph Meehan, of the Germantown Nurseries, Pa., writes me: "The city florists come to us every fall for our small evergreens, which they use for window boxes for their customers in winter. All large hotels and many dwellings use them. The kinds in demand are hemlock, Norway and white spruces, Irish yew, arbor vitæs and the following kinds of retinosporas, namely, ericoides, filifera, obtusa, leptoclada, pisifera, plumosa, squarrosa and Sieboldii. They do not use yellow or white variegated evergreens for outside work in winter, as the variegation is too suggestive of injury by freezing. In hall ways, bay windows and like places the golden ones come in useful and so does the evergreen euonymus. Judging from what sales are made and from what I see, the demand for this kind of decorative stock is increasing every year. The sizes for outside stock are from one to two feet."

THE CLIMBING PERLE DES JARDINS ROSE.—Mr. Gus Bennett, of Flatbush, L. I., writes: "As regards the Climbing Perle I must say I like it very much. I planted out 6 plants in the month of June last year against the rear rafters of a three-quarter span house and they grew very rapidly. About the 10th of November I stopped all the shoots and Christmas week had a beautiful show of roses overhead, as good almost as any Marechal Niel and better as regards color and stems. And I can say that I have been cutting regular crops right along since then. There is no doubt it is a larger and deeper colored rose than the ordinary Perle."

HELICONIA AND PHRYNIUM.—These two plants I think could be made useful to the trade. They came to me from England and the statement was made they were bad travelers and their exportation to America had not previously proved successful. I don't know to what extent this statement may have been found to be true, but the plants which came to me, though certainly in bad condition when received, were rapidly recuperated and grew and grew. I refer to Heliconia aureo-straita and Phrynium variegatum. As ornamental foliage plants I know of none better offered to the public within recent years. They both require stove treatment and with us have grown, colored and developed into specimens that were a joy forever. We discovered them to be wonderfully prolific and whether divided or permitted to grow into half or full specimens, presented beautiful individual and new colors and characteristics which prior to their introduction were not to be found in the long lines of decorations which our stoves and drawing rooms presented. I cannot claim for either of these plants that they are worthy to be classed among the latest novelties, but knowing of the difficulty of their importation I have thought some knowledge of them might be worthy of presentation to the trade as an item of interest and profit. I will only add that the heliconia I think may be made especially useful. Last Christmas a year ago we carried it into our dining room in the dwelling that it might add its attractions to a group of palms, dracænas and crotons, where it not only rivalled in point of grace and color any of its associates, at the same time it stood for weeks bright and fresh, thus demonstrating a lasting quality which will be quickly recognized as of vast value by growers and decorators throughout the land.

F. T. MCFADDEN.

Packing Plants.

Packing plants is an art that is but imperfectly understood by the average florist; that is, outside of the large establishments where the shipping trade is a specialty. The main things to be observed in packing plants are to pack so closely as to prevent any shifting of plants in transit and to make the package as light as is consistent with strength. In winter or early in spring, when there is danger of frost, all boxes in which plants are packed should be lined with paper, using from six to twelve thicknesses of it, according to the class of plants to be shipped, always using an extra quantity on the bottom of the box, as that is where the plants suffer most from draughts or from standing on cold platforms. Small plants at that time of year should be wrapped in paper, wrapping closely and covering all the foliage, then laid in layers in the box, putting a little hay or excelsior between each layer, and when the box is full to within an inch of the top fill it up with hay or excelsior, and fold the paper from the lining over the top and nail on the cover, always having packing enough on top of the plants to require considerable pressure to get the cover down. As the weather becomes warmer use less paper, but always pack in boxes with close covers or covers that will allow the boxes to be upended with safety, until there is danger of heating of the plants, and at this time crates such as bottles are packed in are most useful, as they are light, strong, and allow a circulation of air to the contents.

When the weather becomes warm plants must be packed in open boxes, using only paper enough to wrap up the ball, and leaving the foliage entirely uncovered. Place a thin layer of hay on the bottom of the box, and stand the plants upright, not more than two plants deep, pressing them firmly together so that they cannot move, nail a few narrow strips on the box so that the contents can be seen, and to prevent injury from articles dropped on the box. In cold weather, or if the plants are going a long journey at any time in close boxes, it is best to have them dry. At a large establishment where I packed plants for shipment to all points in the United States and Canada we always left plants for shipment to the Pacific states on the packing bench from Saturday until Monday to allow them to become dried out and we never had any complaints of plants becoming heated. For very long distances, especially if when shipped by vessel, it is best to use no paper; balling the plants in dry sphagnum, tieing the moss firmly about the ball and then placing them in the ends of a box, securing each layer with strips of wood placed across the inside of the box, and nailed firmly from the outside. If the box is long enough a double row of plants can be laid up the middle of the box, the foliage facing that of the plants in the ends, and fill all crevices between the balls with moss. By this method the plants cannot heat, and if well packed will stand a journey of a month or six weeks' duration. Of course if it is cold weather line the box with thick paper and paper up the foliage of the plants.

When shipping plants in pots in summer it is best if the pots are over 6-inch, after packing them in hay, to place a strip across the top of the pots, and nail it firmly to the sides of the box so that there is no danger of the pots shifting and breaking each other. For small orders baskets are very useful, as they are light and easily handled.

When packing good-sized palms for shipment in close boxes it is best to put a stick to the plant and wrap the stick with soft paper to keep the tender foliage from being bruised, then take each leaf separately and tie it to the stick, placing a band of paper around the foliage to keep it from being cut by the string; when the plant is tied up wrap in paper or not, according to the season. If the plants are large, and you have no box long enough to lay them down in, stand upright in a box and secure the pots by means of strips nailed across the top of the pots; then tie the tops together and take a shingle lath and cut strips long enough to reach from the bottom of the box to the top of the plants, nail them to the outside corners of the box, then nail other strips to the upper ends of the uprights so as to make the top secure; pass a strong cord around the plants and fasten to each corner of the frame, and you have a package that is not half the weight of a long box, and can be laid on its side or turned in any position, with no danger to its contents.

Orchids in pots should be tied down first by passing string over the pots and under the bottom, taking care to avoid breaking and bruising the growths and roots; then unless it is a very large plant you can put plenty of moss amongst the growths and wrap in paper the same as other plants. If it is a large specimen each shoot must have a stick to it and be separately wrapped in soft paper; but in packing orchids when in growth bear this in mind, the less paper and cotton or wool used the better they will travel, for most of them damp easily. Orchids

A CALIFORNIA VIOLET FIELD.

on blocks are easily packed; all that is necessary in winter is to pack the plant full of moss to prevent the growths being broken and then wrap in paper and pack in hay in a well lined box. In summer the best plan is to wire the blocks to boards and nail the boards to the inside of a box, then put on the cover, and if securely fastened they will travel any distance.

Large dracænas, ferns, and in fact all specimen plants, should be packed in the same manner as palms. In wrapping up plants in paper a little moss placed around the stem when it is wrapped up prevents the stem being broken or injured when laid down overlapping each other in the box.

All succulent or thick fleshy leaved plants travel poorly, and are apt to damp when going long distances, so they should be kept near the top of the box. When the plants to be packed have tender roots or are not established enough to turn out of the pots without damage to the roots then it is a good plan to turn out of the pot and slip into a Neponset paper pot of the same size, then it can be wrapped up just the same as if out of the pot, and the saving in space and weight is great, also there is less danger from injury caused by plants shifting in transit, for if a pot breaks it allows the others to move and then the shipper gets complaints of plants arriving in bad order.

In conclusion I would say, do not be afraid of packing tight, for the less room plants have to shake in the better they w ll travel.

¡Maywood, N. J. JAS. S. TAPLIN.

Violets in California.

Much has been said in the AMERICAN FLORIST about violet culture in the eastern states, but I have seen nothing on the subject from California.

In the coast counties of California—in fact, along the whole Pacific coast, the violet thrives wonderfully. In the interior regions, where the air is hotter and sun warmer, they can be grown, but not near so successfully. There is, perhaps, no place in the world better adapted to the culture of this popular flower than the region bordering upon the San Francisco bay. They are grown in ridges, generally under the shade of large trees. The plants reach large proportions, and the flowers are of wonderful size, color and fragrance, it being not unusual for the stems to be six or more inches in length and stout in proportion. The plants are not as yet subject to attacks of any disease or insects.

The accompanying illustration is from a photograph of the view of the 5-acre violet field at the Sherwood Hall Nurseries, Menlo Park, San Mateo county, about one hour's ride from San Francisco and in close proximity to the Leland Stanford Jr. University.

As will be seen, the plants are in this case planted under magnificent live and white oak trees. This is by far the largest and finest violet field in the United States, and is worthy of more than passing notice. The varieties grown are the Marie Louise, Neapolitan, Swanley White and the Czar. The season lasts from October to April, and sometimes as many as 1,000 bunches of 100 violets each are picked in a day, and from 12 to 15 men are often engaged in picking at once. The bunches are placed in open boxes, which are removed in wheel-barrows to the packing sheds. A smart man can pick sixty bunches a day. The violets are for the most part sold to the flower stores in San Francisco, and retail at 25 cents a bunch on an average.

The Sherwood Hall Nurseries, which are owned by Mr. Timothy Hopkins, of the Southern Pacific Company, are by far the finest on the Pacific coast, several acres being devoted to sweet peas alone, and as many more to chrysanthemums. A number of the most approved modern rose, carnation and general plant houses have been added during the past year. The establishment has hitherto been run chiefly for supplying cut flowers to the city trade, but arrangements are being made to enter largely into the general shipping trade.

Friend James Lynch, who has charge of this princely establishment, has done himself proud, and can hold his head up among the first of Eastern florists. More anon. EMORY E. SMITH.

San Francisco, Cal.

Newport, R. I.

The floral decorations at "Linden Gate" on the occasion of the marriage of the daughter of Mr. Henry Marquand, August 13, were very elaborate.

The entrance to the mansion through the wide-open hall was a veritable bower. The ceiling was arched and heavily hung with grape vines, extending over the doorways, hanging heavy with bunches of grapes. Guests were ushered into the large dining-room, where the wedding ceremony took place in a broad recess at the southern end of the room. The place was decorated with many garlands and fringes of pure white sweet pea flowers, and maidenhair ferns, forming a beautiful contrast against the stained glass windows, through which the noonday sun's rays lightly played, giving a beautiful effect to the bridal party as they stood during the ceremony and afterward for the reception of guests.

On the mirror in the dining-room were hung garlands of flowers and the mantel was banked with white roses and lilies of the valley. The doorways were festooned with passion vines. The dining-room was arranged with a buffet table holding a miniature lake of blue, pink, and white

water lilies, back of which was a vase of scarlet gladiolus and tall fern leaves and variegated grasses. From the center of the ceiling were hung strands of laurel, after the manner of a May pole. The library was decorated with red and yellow flowers. On the tops of the bookcases were banks of tropical foliage plants.

Another buffet table was spread in a smaller room off the hall, and held a center piece of scarlet phlox. At the east end of the house a large tent was erected connecting with the piazzas and main hall. In it the supporting pillars were covered with fresh cut field corn tied with bows of ribbon. The ceiling's pink facings were canopied with silver maple and the corners were massed with large hydrangea plants in full bloom—white, pink and blue—reaching nearly to the top of the tent.

But the ball recently given by Mrs F. W. Vanderbilt undoubtedly exceeded in elaborateness of decoration anything of the kind before known.

The ball took place at "Rough Point," the summer home of the Vanderbilts. The stone bridge at the edge of the lawn, and against which the breakers dash, was illuminated with calcium lights, the effect resembling a stage scene in a modern theatre. A hundred or more fairy lamps with delicately tinted shades were placed on and about the rocks along the shore and on the grounds, and these tiny lamps were also placed around and across the stone bridge. The grounds were also brilliantly illuminated with small electric lamps and Chinese lanterns. It was a weird and picturesque scene.

The house decorations were superb. The floral decorations were principally in red and white, more especially in the large hall or ball-room, with its mammoth fireplace, rich tapestries and artistic furnishings. The vestibule and outer hall leading to the ball-room were banked on either side with green and variegated tropical plants. Dancing took place, of course, in the large hall which was built with a view to such entertainments. It is situated in the center of the house, and opens from the main floor to the roof and is supported by heavy carved pillars. At the second floor a gallery extends all around the hall, and the front was covered with fragrant flowers, hanging on the face of the woodwork. Just below the gallery were two broad deep fringes of fresh flowers. To introduce electric lights with the flowers and to reduce the extreme height of the roof of the ball-room there were suspended from the rafters several mammoth Japanese umbrellas, on the outer edges of which tiny electric lights were hung irregularly, being partly covered by light garlands of flowers and green, through which the light threw a pale and subdued tint on the dancing floor, the whole being connected by garlands of roses with the fringe work of flowers on the gallery fronts and continued around and through the archways of the gallery in conventional garlands, with heavy pendants. From the heavy iron electric light brackets, of which there are fifteen around the hall, were hung large floral placques, festooned with flowers, and each light was covered with a tulip-shaped shade. In the large stained glass window, which extends to the full height of the hall, stood an immense tree fern, with long, gracefully spreading fronds, under which many of the guests were seated. A pyramid of ferns was formed at the base of the tree. The wide staircase leading to the galleries was heavily draped with passion vines in full bloom and over two thousand roses were used as well.

In the large reception room which adjoins the halls, and forms a passageway to the dining and billiard-rooms, where supper was served on small tables, as well as on the piazzas, was arranged a large water lily tank, containing specimens of many of the various colored lilies and an abundance of lotus flowers. The feature of the room was the decorations with wild grasses and bullrushes. The dining-room, resembling a banquet hall, is in oak. The tall mantelpiece and huge fireplace were massed up with tall foliage plants of the finer varieties, and the shelf was a study of gloxinias, allamandas and Farleyense fern fronds. Over the mantel the panels were filled in with American Beauty roses and ferns. Center pieces of flowers and candelabras, with wreaths of flowers, were placed on each of the seventy-five small supper tables.

The verandas on the ocean side of the house were connected by two large tents, one of which was left open at one end to open up the grand marine view, with its calcium lights and fairy lamps. The features of the decorations in the tents and on the stone floored verandas covered with rich Turkish rugs were the tall pyramids of hydrangeas, flowers of various colors and laurels at the stone pillars while the roof was covered with oak boughs.

Japanese lanterns were hung beneath the red, white and blue canopies. The cut glass globe in the center of the mammoth Japanese umbrella in the ball-room was illuminated by a 250 candle electric light, while the one in the alcove was lighted with a 100 candle power light, while throughout the first floor 10,000 candle power was used. Streamers of roses and smilax, each thirty feet long, and tied here and there with satin ribbon, were attached to the center umbrella and strung across the hall over the heads of the dancers, and tied to the enclosing balconies.

Both decorations were arranged by Hodgson. M.

Boston.

The annual meeting and election of officers of the Gardeners' and Florists' Club took place on Tuesday evening, Sept. 1. The list of nominees as presented by the nominating committee was as follows: President, J. H. Morton, Mattapan; Vice-President, W. H. Long, Boston; Secretary, Elijah A. Wood, West Newton; Financial Secretary, Rob't Farquhar, Boston; Treasurer, W. H. Elliott, Brighton; Executive Committee, Lawrence Cotter, Dorchester, Kenneth Finlayson, Brookline, L. T. Peck, Boston, Edw. Hatch, Boston.

The whole of the above ticket was elected with the exception of Mr. Elliott, who persistently declined to accept the position of treasurer. Several other gentlemen whose names were proposed also refused to serve and it appeared for a while as if the club would be unable to find anyone willing to take care of the money, a condition of affairs worthy of record. Had the election taken place previous to the exodus to Canada perhaps it would not have been so difficult to find a willing treasurer. Mr. F. W. Foster of Boston was finally elected to fill the position, although he made a futile attempt to follow the example of the others and withdraw.

The meeting was a large one. The report of Mr. S. J. Coleman for the committee on the Toronto bowling tournament was listened to with interest and the cup which had been brought home as third prize by the bowling team was passed around for inspection. The members of the bowling team had to take considerable chaffing as to their inability to cope with the experts from Philadelphia and New York. Regarding the disposition of the cup it was finally voted that an arrangement be made whereby every member of the club desiring to should roll for it, the cup to become the property of the individual making the highest score.

President Foster reported for the delegates who had been sent by the club to the meeting of the Florists' Clubs at Toronto. On motion of Elijah A. Wood it was voted that in future the annual supper of the club should occur on the evening of the first day of the chrysanthemum show instead of in January as heretofore, so that the club might have the benefit and pleasure of the company of the many worthy gentlemen from distant parts who are liable to be in the city at that time.

A committee was appointed to prepare appropriate resolutions on the death of Mr. W. S. McGregor, who was a member of the club.

The retiring president, Mr. L. H. Foster, made a few valedictory remarks, congratulating the organization upon its prosperity during the past year, and then relinquished the chair to his successor, Mr. J. H. Morton, who was welcomed with much applause and who in a few well expressed words thanked the club for the honor conferred and expressed his zeal for the work of the coming year. Before adjournment a vote of thanks to the retiring officers was unanimously passed.

W. S. McGregor, the victim of the recent assault on Bosworth St., was buried from the Congregational Church in Woburn on Monday, Aug. 31. The funeral was very largely attended, among those present being a delegation of about thirty-five from the Gardeners' and Florists' Club and a large number from the Scottish Clan, of which deceased was a member. The display of floral designs was very extensive. Daniel Downey, his assailant, has been held on a charge of manslaughter.

Mr. Robert Cameron, head gardener of the Harvard Botanic Garden, has returned from Europe, where he has been spending a few weeks looking over the floral and botanical treasures of the old world.

Mr. P. Welch, who left the Boston party returning from the Toronto meeting, at the White Mountains, has been heard from. His diary of the first few days is something in this fashion: Went to bed; got up for breakfast; went to bed; got up for dinner; went to bed; got up for supper; went to bed. W. J. S.

Philadelphia.

The meeting of the Florists' Club on Tuesday evening, September 1, was largely attended. Officers to serve for the ensuing year were nominated for election at the next meeting of the club. A paper was read by Mr. Robert Craig, the subject being, "What Was Accomplished at Toronto." It was well received and ordered to be sent to publication committee.

The club is increasing in membership and the attendance and the interest taken by the members is very encouraging. Committees were appointed to look after the interests of the coming chrysanthemum show. The matter of decorating the hall for these occasions has been taken in hand by the club for some time past, and this year they promise to do

better than ever. They are also making efforts to improve the library room of the Horticultural Society, where the business meetings of the club are held. The books of the library are all placed around the room in cases having wooden doors; it is proposed to replace these with glass, through which the books can be seen. There are many old and valuable works on these shelves, to which it is proposed to add new books of interest to the members as they can be obtained.

Isaac Kennedy, foreman for Robert Scott & Son, has resigned his position and is about to enter into partnership with George Campbell. They have rented Mr. Campbell's father's place, who will now retire from business. The greenhouses are quite extensive and well stocked with a general variety of plants. We wish them success.

John Leitch, formerly with George Craig, has opened a floral establishment at 259 South Eleventh street. This addition will make five cut flower stores in two blocks. If competition is the life of trade there ought to be plenty of life on Eleventh street the coming season.

John Kinnear, a landscape gardener of Philadelphia, has moved to Richmond, Ind., to take charge of and lay out a new park in that city.

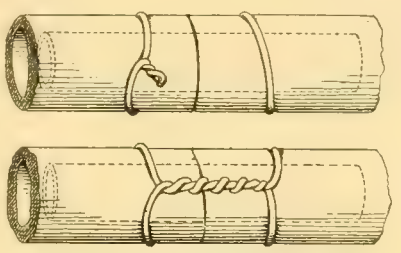
Business is about as usual at this season of the year, and the supply of flowers easily equal to the demand. Some new crops of roses are coming in and look well, but like all early cuts are short in the stem. Perles, Sunsets, and Niphetos bring $2 a hundred, while Mermets, Brides and La France command $3, and some have the temerity to ask $4. Carnations $1 a hundred, asters, heliotrope, bouvardia, from 10 cents to 25 cents a bunch. Sweet peas are about done. Tuberoses can be had in quantity, and the best sell for $3 a hundred.

The Florists' baseball club of Philadelphia were invited to play a game with a club made up of players principally from the greenhouse establishments of Chestnut Hill and vicinity. The time fixed was Saturday, September 5. The city boys were promised a good time. "Of course we don't expect to win, as you can easily beat us, but come up and we will have some fun anyhow." Lured by these and similar remarks the city boys accepted the invitation and had all that was promised but that which they really sought, namely, the "game" they left behind them.

It was a great game of ball, requiring ten innings to decide. At the end of nine innings each side had one run to its credit; in their half of the tenth the "Mermaids," for such they styled themselves, made three runs. The florists in their turn tried to tie or go one better; they managed to get two men across the plate and one as far as third, but there he was left, the last man striking out, and so the Mermaids won with the score 4 to 3 in their favor. After the game the company adjourned to the greenhouses of Mr. Knapp, where a lunch was served, after which the florists turned homeward and discussed the many ifs that might have won the game.

At the club room the attendance has been good since the return from Toronto. Of course the result of the match was heralded with delight and the boys were showered with congratulations. The cup will occupy a prominent position in the club room in a nice glass case. New pins and some new balls have been ordered, and now "for Washington" is heard on all sides.

The team that won the cup has been challenged by six good men that could not go, but think they can beat the winners. The match comes off Thursday evening, Sept. 10. Some good scores have recently been made, W. K. Harris placing himself among the leaders with 216. &.



Chicago.

The flowers sent to Mr. John Thorpe on the occasion of his installation into the office of Chief of the Division of Floriculture of the World's Columbian Exposition were afterward distributed among the heads of departments at headquarters and the ladies came in for a very large share. See elsewhere for a list of the arrangements and donors.

Mr. C. F. Klunder, formerly of New York, will open a store at 185 Michigan Ave., near the Richelieu Hotel, about the 15th inst

Mr. Wm. J. Smyth, formerly with E. Weinhoeber & Co., has returned from his eastern trip and will soon open at store at 270 Thirty-first street.

Some very important matters will be brought before the Florist Club at the meeting this Thursday evening (10th) and a full attendance is specially requested.

HOSE MENDER.

Mr. J. C. Vaughan is adding five new houses to his establishment at Western Springs. One 120x25 is for palms, one 150x20 for roses, one 150x16 for cannas, one 150x11 for general plants and one 120x15 for propagating. All are being put down in first class style, on the principle that one heavy first investment is cheaper than frequent rebuilding.

The ponds of aquatics at the parks are unusually beautiful this year, especially the upper ponds in Lincoln Park. The cold winds of last week did not do them any good however and those that have not yet seen them should lose no time in doing so if they do not wish to lose opportunity of seeing them at or near their best.

The garden of hardy plants at Lincoln Park is also making a beautiful display now, the hollyhocks, hardy phlox, rudbeckias, double sunflowers, etc., making a fine display. Some gaillardias now in bloom promise some beautiful effects when grown in quantity and a very pleasing display at present is the border of blue and white day lilies around the fountain, all being covered with bloom, the blue variety being simply a mass of flowers.

Among sub-tropical foliage plants on trial at the park Mr. Pettigrew is very favorably impressed with Wigandia macrophylla (caracasana), and it is certainly a beautiful thing.

The iron frame work of the new palm house at Lincoln Park is nearly all complete and the glass is arriving. Glazing will be begun this week. But the building will probably not be ready for plants before January.

Among recent visitors to the city were two Kentuckians, Messrs. S. J. Thompson of Louisville and T. C. Hobbs of Anchorage.

Mr. D. S. Heffron has a magnificent specimen of Hydrangea paniculata grandiflora on his place at Washington Heights. It is 14 years old and is 12 feet high and about the same in diameter, it having been trimmed annually to preserve this form. This year it bore fully 1000 heads of bloom, and Mr. H. sold $10 worth of bloom from it and without cutting all there was in sight. Any florist who retails his own flowers and has not a few specimens of this valuable shrub on his place should lose no time in planting some. When they have become well established they will produce a lot of flowers that come in very handy in summer time to use as the groundwork in funeral arrangements and in other ways. And needing no special care or expense the product is nearly all clear profit.

The trade is showing a little more life from week to week. The improvement, to be sure, is not very marked as yet, but there are unmistakable signs of returning activity. Society is beginning to gather in the city again, as is evidenced by orders for baskets and boxes of cut flowers with the "welcome home" card attached. The boys are beginning to rub off the rust which has been accumulating in the last three months, and getting ready for another nine months' siege of hard work.

Prices are stiffening on roses. An advance of $1 per 100 is quoted by the commission men on all good stock.

Hose Mender.

The accompanying engraving gives views of opposite sides of a section of hose sent us by Mr. John McGowan, Orange, N. J., to illustrate a simple method of mending hose practiced by him for years. It is certainly a very useful little wrinkle and we are glad of the opportunity to place it before our readers.

After trimming evenly the ragged edges of the break in the hose a short section of half inch iron pipe is inserted as shown by dotted lines in the cut. Then a piece of galvanized iron wire is wrapped around the hose as shown at the right in the upper figure and twisted tightly so as to sink into the rubber. The wire is then twisted for a few inches as shown in the lower figure, again wrapped around the hose and fastened as shown at the left of the upper figure.

The great value of this mender over any other we have seen is in the fact that the two parts of the hose are held securely together by the twisted wire as shown in the lower figure, and if the wire is twisted well into the rubber it is quite impossible for them to pull apart.

This mender is not patented, and the materials for making it are inexpensive and easily obtainable. Mr. McGowan has our thanks for the section of hose from which the engraving was made.

A SAMPLE flower of a seedling tuberous begonia is sent us by Mr. G. Foust, Rhinebeck, N. Y. The bloom exceeds three inches in diameter, very full double, high in the center and pure white in color. It is certainly a very fine flower, the finest double white we have seen.

THE REPORT OF THE COMMITTEE ON NOMENCLATURE.

This was an exhaustive, very carefully prepared and important paper, which, when it appears in the proceedings of the S. A. F. may answer a good many questions and cause a good many ears to tingle. The committee have handled the question of nomenclature of garden plants in a bold and uncompromising form. They have given attention to synonymy among varieties, and expressed themselves in the matter of English names for common plants, their use, and abuse. They believe in botanical names for all species of plants and that it is the province of the scientific, systematic botanist to attend to the botanical nomenclature of species and pronounced natural varieties, but they jealously uphold the right of the people to give common or English names to all plants.

As regards the proper pronunciation of botanical names as gladiolus, clematis and the like that folks sometimes like to cavil about, it is referred to the exhaustive article on this subject in the supplement to Nicholson's Dictionary of Gardening, which article is highly endorsed.

They deny the right of anyone to preempt a name for a plant before the plant is published.

They handle without mercy those who exaggerate or falsify the descriptions of plants in their catalogues, and severely warn those who falsify the illustrations of their plants. And one of the most stirring paragraphs in the report is contributed by "that grand old florist, Louis Menand of Albany, who now is in his 85th year."

It is gratifying, however, to learn that the committee have found the nomenclature question in a much healthier condition than it was some years ago, and that the general tendency in the trade is to give truthful statements regarding the plants catalogued, and many of the florists go so far as to give the botanical name of all new and uncommon plants, so far as they can, in order to render the identity of the plants quite visible to their customers.

Every instance of an error in the description or identity of a plant noted in any catalogue, as soon as it was brought to the notice of the committee was immediately investigated. Most times these errors were accidental. Where they occurred through indifference, carelessness, or intention, if the florist or seedsman acknowledged the error, all was well, that is if it be not repeated another year, but should the same thing occur again the case will be brought to public view.

Some folks were apt to make light of the labors of this committee but when they read the report and couple it with the fact that this committee still holds sway and is yet actively at work, they will see where it will pay every florist in the country to be straight and keep straight.

As the report of the committee on nomenclature was not presented till Thursday night (the last session of the convention) and on account of its great length, and an unusual press of business at the session, it was not read in full, only a few of the most salient points were given by the chairman, but it will appear in full in the proceedings of the society.

THE REVIEW OF NEW PLANTS.

Although we have quoted largely from Mr. Wm. Falconer's paper on this subject we have not by any means, exhausted it, for in addition to what we have used it contains important articles on orchids, hardy plants, hardy roses, bulbs, and many miscellaneous subjects, by eminent correspondents, and all of which will duly appear in the annual proceedings of the Society of American Florists.

AN ADVANCE SHEET giving list of premiums to be competed for at the annual spring exhibition of the Pennsylvania Horticultural Society, to be held March 29 to April 1, 1892, has been issued. Over $1,500 are offered in premiums, of which $800 is for plants in pots, $200 for cut flowers (open to growers only), $130 for cut flowers (open to florists only), $324 for floral arrangements, table decorations, and plant decorations, $37 for fruits and $70 for vegetables. Among the premiums offered for plants in pots are very liberal prizes for flowering bulbs in variety, and for orchids, the prizes for collection of orchids in bloom being, 1st $75, 2nd $50. Special premiums amounting to $52 are offered by John Gardiner & Co., for 24 specimens of mushrooms. Another special premium, a silver cup, is offered by Mr. Robert Craig for twelve blooms best carnations, new variety, not disseminated. The competition for this cup will undoubtedly be a most interesting feature of the exhibition. Copies of the advance sheet may be had on application to the secretary of the society, Mr. D. D. L. Farson, Horticultural Hall, Broad street, Philadelphia.

WHETHER it is overproduction or something else, the men in the trade at the large producing centers who have a reputation for far-sightedness are making but few additions to their glass surface. But there is a vast amount of repairing going on. Seems as though the wise men in the trade were turning their attention more to making every square foot of their present plant pay every penny it can be made to pay rather than to spread out over a larger surface. There are few establishments in the country where an investment in improved substantial houses to take the place of less convenient ones and in more and better labor and labor saving tools, would not be far more profitable than an extension of glass surface.

THE MACHINERY of the Bureau of Horticulture of the World's Columbian Exposition and of the Division of Floriculture are at last in motion. It would have been better had the start been made earlier, but by pushing matters along rapidly now there is still time for the preparation of one of the grandest displays ever seen. But no time must be lost now. What will you exhibit? Communicate now with Mr. John Thorpe, Chief of the Division of Floriculture, World's Columbian Exposition, Chicago, for any information you may desire, of either a general nature or regarding the details in which you are specially interested.

SUBSCRIBER.—No. 1, material insufficient for determination; No. 2, Eschscholtzia californica; No. 3, Platycodon, probably P. grandiflorum; No. 4, a malvaceous plant, but the material is not enough to justify one in saying precisely what it is. In sending plants for name not only should full and perfect flowers be enclosed, but also leaves and seed vessels where obtainable, and the sender should also give full particulars about the plants.

IT IS PLEASING to note the cheerful tone of the reviews of the commercial situation, of the prophecies of large crops and consequent great activity in general trade. With money abundant and our customers prosperous we may look for liberal sales and prompt collections. May these pleasant prospects be real and may the florists of America reap their share of the promised prosperity.

Catalogues Received.

Pierce, Butler & Pierce Mfg. Co., Syracuse, N. Y., the Florida Greenhouse and Heavy Duty steam and hot water heaters and improved Pierce air valve; S. Wilks Mfg. Co., Chicago, the Wilks heaters; E. M. Rumph, Marshallville, Ga., plants; John Gardiner & Co., Philadelphia, Pa., bulbs; United States Nurseries, Short Hills, N. J., new and rare plants; same, orchids; same, hardy perennials; Phila. Immortelle Design Co., Philadelphia, Pa., florists' supplies; L. Green & Son, Perry, O., nursery stock; Siebrecht & Wadley, New Rochelle, N. Y., orchids, decorative plants and bulbs.

News Notes.

BELLEVILLE, ILL.—A. S. Halstead has just completed two new rose houses 20x123 each, and one new carnation house 11x123.

DANVILLE, ILL.—The Maple Hill Floral and Nursery Co. has been incorporated with a capital stock of $10,000. The incorporators are J. H. Woodmansee, Grattan Hall and A. C. Wasson.

SEATTLE, WASH.—The Woodland Park Floral Co. has completed two new houses, one 75x20 for roses, and one 75x14 for general plants. The company contemplates the erection of two more houses at once, each 75x14.

MILWAUKEE, WIS.—Mr. H. Schwebke will vacate the present leased greenhouses and occupy three new ones of his own, now nearly finished. They are on the Lisbon road. Two of the houses are 100x16 each, and the other is 100x10, all to be heated by steam. Mr. S. will use them for growing roses, carnations and smilax for his retail trade. His city address remains the same as before.

WASHINGTON, D. C.—The coming session of the American Pomological Society, to be held here September 22 to 24 inclusive, will, it is believed, bring together one of the largest assemblages of fruit growers ever known in America. The programme covers nearly every question of interest to pomologists, and the essays are to be prepared by men of national reputation in their special departments. The coming meeting bids fair to much further extend the influence of this society which has already done so much to advance the best interests of pomology.

The Seed Trade.

AM. SEED TRADE ASSOCIATION.

F. BARTELDES, Lawrence, Kan., president; A. L. DON, New York, secretary and treasurer. The tenth annual meeting at Hartford, Conn., second Tuesday in June, 1892. Applications for membership should be addressed to Wm. Meggatt, chairman membership committee, Wethersfield, Conn.

New York.

Chas. Henderson, recently returned from an extended European trip, is the guest of his brother at the Wilburton, Spring Lake, N. J.

When last heard of Wm. Elliott Sr., of Dey street, was enjoying the beauties of the grounds around Blarney Castle, Cork, Ireland. He did not kiss the Blarney stone, in fact he didn't need to, as anyone who has ever listened to the eloquent auctioneer well knows. His absence from Toronto was regretted.

A matrimonial wave is beating briskly around the seed stores, to-wit: The recent ventures of Willie Richards, of Thorburn's corps, and Charlie Littlefield, of Peter Henderson's. More to follow when the harvest moon is full.

THE CALIFORNIA onion seed crop diminishes as the season advances. A good judge who has been carefully over the ground gives it as his opinion that the crop will not clean up over 50 per cent of what it has been for the past two years. The area planted was considerably less, owing to scarcity of onions, and the hot weather in June hurt most of the stock. Whites are almost a failure. Lettuce and celery will be full crops.

THE MAMMOTH CHESTNUT CO. has been incorporated at Camden, N. J., and Philadelphia, Pa., with a capital of $60,000. They propose to buy, sell and cultivate all kinds of seeds, nuts, fruits, trees, vegetables, etc.

THE LOW average temperature of the past ten days causes considerable anxiety among the trade concerning all crops liable to injury by frost, sweet corn, beans, vines, etc.

D. M. FERRY & CO. are building a large addition to their warehouse. Their onion seed crop while not quite a full one is larger than usual owing to increased acreage.

DISCOURAGING reports come from the Nebraska seed growing districts. Some predict less than one-half an average crop.

PLEASE mention the AMERICAN FLORIST every time you write to an advertiser in these columns.

S. B. HICKS, representing Cooper, Taber & Co., London, is making his annual trip.

VISITED CHICAGO: H. W. Buckbee, W. W. Tracy, William Meggat.

SITUATIONS, WANTS, FOR SALE.

Advertisements under this head will be inserted at the rate of 10 cents a line (seven words) each insertion. Cash must accompany order. Plant advs. not admitted under this head.

TO LET ON LEASE.

For a term of years, one of the **Largest** and most **Complete** Greenhouse establishments in the **West.** For particulars, apply to

HORTICOLE,
Grand Central Hotel New York City.

FOR RENT.

Three greenhouses, with dwelling, in good condition, situated just outside of Milwaukee, suitable for growing for either wholesale or retail trade. For particulars, address
WISCONSIN FLOWER EXCHANGE,
131 Mason Street, MILWAUKEE, WIS.

A Splendid Business Opportunity.

I will sell my half interest in our seed business, because I have made money enough and wish to retire from a busy life I established the business in 1868 and have made money ever since. Our town of 9,000 inhabitants is growing rapidly and we have the largest seed trade in town. I can leave a partner who has had 7 years' experience, is young and honest. This is a fine opening for a man with a few thousand dollars who wants to live in York State.
Address SEED3MAN, care American Florist.

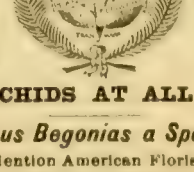
For Sale.

AT PUBLIC OR PRIVATE SALE at 2 o'clock p. m. on the 15th day of September, 1891, the large Greenhouses of WM. DESMOND & CO. of Minneapolis, Minnesota; best location in the city, and large established trade. Good reasons for selling. For particulars address
SANFORD F. HOLBROOK,
Bank of Minneapolis Building, Minneapolis, Minn.

FOR SALE.

Nine greenhouses, 10,125 feet glass with 2 acres of land and stock for sale very cheap, and on easy terms; the reason is retirement from business and inability to devote the time to it.

The houses are new and in splendid condition, situated in one of New England's best localities, with a large and extra good home market and established trade. Three houses 60x18 feet four houses 60x10 feet, one house 60x22 feet, one house 75x14; 8,000 plants of general stock; 2,000 roses planted this summer and ready for bloom now; 5,000 carnations of the leading varieties; 3,000 violets; 1,000 chrysanthemums; a bed of young strong smilax—700 strings; stock of palms and decoration plants, representing a wholesale value of $500; hardy shrubs, vines, etc., wholesale price $ 50. A complete supply of winter forcing and bedding bulbs, and 10,000 lily of the valley just imported, representing a wholesale value of over $400; 60 sash 4x6 feet for cold frames; also 20,000 pots, all sizes. The houses are all complete with steam heating apparatus—a new twin boiler of the "Florida" pattern with 3,000 feet of pipe. There is a large splendid potting shed with office building, and all necessary tools and implements.



The price on property land, houses with stock, heating apparatus, tools, implements, etc., etc., is $6,500, part of which can stay in the property as first mortgage. For further particulars, write to

WHY You Should Grow Mushrooms.
Because they are the most profitable crop for the outlay that can be grown and may be grown without interfering with other crops. The market is sure, the supply never having been equal to demand.

WHEN You Should Grow Mushrooms.
During the Winter and Spring months, the first planting in August or September with successional planting until April.

WHERE You Should Grow Mushrooms.
Under the greenhouse benches, on the greenhouse benches among growing crops, in Rose Houses, in frames in the greenhouse, in cellars, stables or outhouses, in the open field or in mushroom houses.

How You Should Grow Mushrooms.

First get spawn that will grow. It must be fresh, well spawned, and in good condition. **Gardiner's Celebrated English Mushroom Spawn** is the best, and is always fresh and reliable. The details of culture are given concisely in our treatise, **"Mushrooms for the Million,"** Mailed free. **Falconer's "Mushrooms and How to Grow Them."** Published at $1.50. (Gardiner's price $1 35 post free.) **Robinson's "Mushroom Culture,"** 50 cts. postpaid.

GARDINER'S ENGLISH MUSHROOM SPAWN.

John Gardiner & Co., have made a specialty of choice spawn for years, and their celebrated English brand (made by the best maker in England, specially for their trade), has gained an enviable reputation among critical growers for its uniform good quality, and can be thoroughly relied on to produce a good crop of the best mushrooms. Orders booked now for delivery as wanted, $8.00 per 100 lbs. Special rates to large growers. Address all correspondence to **21 North Thirteenth Street,** Philadelphia, Pa.

The true Hamburg and Berlin pips, extra strong, 3 years old, packed in cases of 2000 and 2500; per 1000, $9, per 10,000, $80; free on board cars at New York.

SPECIAL QUOTATIONS ON LARGER QUANTITIES.

CHAS. SCHWAKE,
318 E. 85th ST., NEW YORK.

Put Them in Your Scrap Book.

"If we would have our profession keep pace with the industrial and material development of our country, it is incumbent upon us to dig deep and lay wide the foundations on which the future of our profession is to rest." E. G. HILL.

"Only by going where the honey is to be found can the bees lay up a store. Staying at home is synonymous with an empty hive." A. E. WHITTLE.

"We want more scientific knowledge of culture, but it must go hand in hand with the practical knowledge we call rule of thumb." EMILY LOUISE TAPLIN.

"All good things do not grow in the West nor the East, but are liable to crop out anywhere, and those who travel with open eyes can always learn something." ROBERT CRAIG.

The above very happy quotations were placed by Secretary Stewart at the top and bottom of the pages of the convention programme distributed at Toronto. They are good enough for reproduction every year, and we make no excuse for reproducing them here.

YOU CAN give the AMERICAN FLORIST your fullest support by confining your orders to those who advertise in its columns, and when ordering mentioning the fact that you were induced to order by the adv. in the FLORIST.

WHEN sending us small amounts in postage stamps, please select those of the 2-cent denomination.

The S. A. F. in Canada.

I am glad the predictions of many florists throughout the country that few of the members of the S. A. F. would care to go to Canada, were not verified. Although unable to attend the convention myself, I cannot tell how glad I am that so goodly a number availed themselves of the opportunity thus offered to become better acquainted with the brethren over the border, and at the same time see Canada. Having myself been the recipient of Canadian hospitality on many occasions, I could safely predict that the welcome extended to the S. A. F. by the Toronto Club, and by the city itself, would be most hearty. As I was so fortunate as to have my home, for nearly four years, at Brockville, Ont., the beautiful little "City of the Thousand Islands," I can honestly testify to the genuine whole-heartedness and singleness of purpose of the Canadian people when they undertake to do a thing, and I am glad for the name of our Society of American Florists that they turned out so nobly. If the same spirit manifested by the members of the S. A. F. and the good people who attended the National Educational Convention, held in Toronto a few weeks ago, was shown by the people in general in our country it would do more towards cementing the bond of brotherhood between us than any other power in existence. Are not the Canadian people Americans as well as we of the "States"? And are we not a Society of *American* Florists? Then why should we not as well meet in Toronto as in Boston or Washington? That many thought as I think is evident, and I am sure the trip to Canada has helped to remove many erroneous impressions from the minds of many members of the society, and none will ever regret their first trip to Canada. During my residence in Canada I became fully convinced that the time is not far distant when we shall be able to meet in Ottawa or Montreal and not be annoyed by that bugbear, who tries the patience of even the most loyal, the customs officer. Few I am sure, who had not before been in Toronto, had the slightest idea of the beauties of the city they were about to visit, or of the treat in store for them, and certainly none will ever forget the hearty welcome extended to all by our Canadian cousins. The next time the S. A. F. meets in Canada I trust it may be my good fortune to meet with them.

EDWARD SALYER.

THE CHEAPEST AND BEST OF ALL.

FIR-TREE OIL
INSECTICIDE—soluble.

FOR PLANTS.—To make a solution for washing or cleansing purposes—Half-a-Pint of Fir-Tree Oil to ten gallons of water.

For Green and Black Fly, Thrip, American Blight, Wooly Aphis, etc.—Half-a-pint of the Fir-Tree Oil to two or four gallons of water, or two or three tablespoonfuls to the pint.

For Red Spider and Caterpillar—Half-a-pint of the Fir-Tree Oil to two gallons of water, or three tablespoonfuls to the pint.

For Mealy Bug, Brown or White Scale—Half-a-Pint of the Fir-Tree Oil to four or six quarts of water, four to eight tablespoonfuls to the pint.

For Mildew and Blight on Fruit or Foliage—Half-a-Pint of the Fir-Tree Oil to a gallon of water, or six tablespoonfuls to the pint.

Used with warm water it is quicker in its action than when cold is used.

Soft or rain water is necessary, and Applied in Wood, Tin or Pot Vessels.—Galvanized Iron Vessels must not be used.

FOR ANIMALS.—For Skin Diseases and Killing Vermin mix one part of Fir-Tree Oil with three parts of warm water and wet the affected part each day. In some cases it may be used stronger. For Ring-worm apply full strength with a brush each day.

FOR BIRDS INFECTED WITH PARASITES.—Put a tablespoonful of Fir-Tree Oil in one quart of warm water and dip the bird in it, taking care that its eyes are protected, hold the bird in one hand for one minute, then dip into clean tepid water; this may be repeated. If necessary a much weaker solution may be used with a spray producer.

Sold in Bottles and Tins.

AMERICAN FLORIST CO., 54 La Salle St., CHICAGO.

DOUBLE RUSSIAN VIOLET.
NEW HARDY VARIETY FOR OPEN-GROUND CULTURE.

We have much pleasure in now offering for the first time this hardy Violet, grown by Mr. R. J. Donovan.

This Violet has been grown at Chicago for five years, planted in the open ground with no protection beyond covering the beds in late fall with forest tree leaves. The soil is very sandy—too poor to grow geraniums, somewhat shaded by large trees.

From a bed 150 feet by 4 feet wide, Mr. D. sold the crop of 34 000 flowers at wholesale in Chicago for $204.00.

The style and habit of the plant is similar to M. Louise. The leaves, however, are less smooth or glaucous. Flowers large, very double, deliciously fragrant, and of a very deep shade of blue—darker than M. Louise—one or two petals in each flower being dotted with red.

The season for cutting lasts about four weeks, commencing here in April lasting well on into May. Mr. D. estimated the profits at 90 per cent., the labor and care being but a trifle.

Propagating the Clematis.

"Subscriber" asks in the FLORIST of August 13 about propagating the clematis. They are propagated by seeds, cuttings, grafting and some kinds by layering. The safest method for the inexperienced is to graft, using half matured wood for the scion on the roots of Clematis flammula. If the wood is grown inside the results are much more certain. The grafting should be done early in the season, as wood can then be had in the right condition. If wood is scarce one joint on the scion will do. Layer grafting can be done with plants growing in the open pround. A slit is cut in the growing branch, the end of the root pared on both sides, neatly pushed into the slit and tied with soft twine that will rot off soon, then the branch so treated is covered with earth at the point where the root is set in, the growing end of the branch, of course, being left out to continue growing and receive more grafts. The "Jackmanni" can be worked by either of the above methods. The Duchess of Edinburg (large double white) will root freely by being layered in the ordinary way. E. FRYER.

FROM THE amount of World's Fair matter that appears in this issue we may safely call this a "World's Fair number," and still we were unable to get in all that was worthy of space, even after adding on four extra pages.

WHEN you write an advertiser tell him that you saw his advertisement in the AMERICAN FLORIST.

WARMER WEATHER brightens the prospect for seed crops of corn and vines.

FOUR EXTRA PAGES this issue on account of press of news matter.

Floriculture at the World's Fair.

Last Friday there arrived in Chicago, in response to a call issued by Chief Thorpe, of the Division of Floriculture, the following members of the Society of American Florists, to consult and advise with him regarding the work of his Division: James Dean, Bay Ridge, N. Y.; Robert Craig, Philadelphia; John Chambers, Toronto; E. G. Hill, Richmond, Ind.; W. A. Manda, Short Hills, N. J.; Wm. Hamilton, Allegheny, Pa.

Accompanied by Chief Samuels of the Horticultural Bureau, Mr. Thorpe and a number of Chicago florists, these gentlemen visited the Exposition grounds and viewed the site of the Horticultural building and afterward held a meeting at World's Fair headquarters.

Mr. James Dean was made chairman and Mr. Robert Craig secretary of the meeting, there being added to the committee Messrs. Edgar Sanders and J. C. Vaughan of Chicago.

Upon the request of the chairman, Mr. Thorpe gave his views as follows:

The object of our meeting is to devise ways and means to make the horticultural department a success. There is at the present moment something that interferes with that success and that is the position of the horticultural building, with its present outline. I may say, however, that we are sure to get what we need, which is that the horticultural building be put back to the lines originally contemplated, which will give on the front of the building 250 feet, instead of the present proposed 180 feet. You will readily understand the reason I make this objection to having that building, of which 40 feet is the lowest stature, brought within 150 feet of the lake. My idea is to get the building back to its original lines. The architecture and decorations of the building is classical and superb, and we must decorate the grounds in accordance with the architecture. Hence the necessity of having the building put back. It will be put back 180 feet from the present line.

When I summoned you gentlemen in the early part of the week I felt that I was snowed under; but things have developed in regard to the appropriation of space so that you can congratulate the horticultural department of the World's Fair on what we have obtained. For instance, the wooded island, according to Mr. Olmsted's original plan, was not to be approached, sat upon, or tread upon. In conversation with Mr. Burnham and other gentlemen who are in a position to see the necessity of it they said, "The island is placed at your disposal." You ought to congratulate the World's Fair upon what they are doing for floriculture in allowing us to use their island after saying it could not be tread upon. The island presents to us an opportunity that has never been given to any other association in the world. We can contribute mural, architectural, and artistic decorations as we like. We can do what we like with it. The extent of the island is 17 acres.

The surroundings of the woman's building have by common consent been given to us to take care of, and we are going to do it in such a manner that it will be a credit not only to us, but to the world. The state buildings are also under consideration, and it may be that in a short time I can tell you that we will have the decoration of the grounds of the state buildings, which extend over all of the improved part of Jackson Park. If such is the case we can exhibit all varieties of decoration.

The matter of money with which to get this thing running is the next problem. We cannot undertake this gigantic enterprise without a large appropriation. Coming down to hard facts, this is a very, very serious question I want you gentlemen to consider: How much should be asked for to make this thing the success it ought to be? We are not like the artists, mechanics, or machinery men; we spread our business all over the World's Fair. It seems to me that we ought to have not less than $750,000 if we are going to make this thing a success. That is for you to discuss, gentlemen. I am calculating this on business plans: How much per foot it takes per year to keep up an establishment. It is safe to say $1 per foot per year is what it costs to keep an establishment in order. There is in our building 250,000 square feet. That means $250,000. To equip that you know will necessitate the expenditure of a large amount. I think the equipment will not cost less than one-half of the amount I have named. The maintenance of the grounds outside and the number of plants we will have to use, will bring up the expense, so far as I can economically calculate, to not less than $750,000. We have the opportunity of our lives to make this the most glorious thing that has ever been done in the world, providing we have the support we are entitled to. The bulb growers are willing to exhibit not less than 3,000,000 bulbs. The growers of pansies, who are spread all over this wide world, from here to Belgium, from Belgium to France and Germany, and back over the island we are all pleased to know—Great Britain—will contribute not less than 500,000 pansies, provided we have the space to display and care for them. The rose growers of the world are anxious to display, and we can get 100,000 roses. Coming down to old-fashioned flowers, I am sure we can get miles and miles of these to put on the grounds and the island, but of course it takes time and money to take care of them. Aside from these is the great variety of annual flowers, and there is no country in the

world where they do as well as here. The phloxes, asters, zinnias, rhododendrons, and everything else of that kind can be brought about by that time. I think we could have between three and four acres of rhododendrons.

It seems to me that we should have some temporary structure or structures in such shape that we could accommodate any exhibits that might be presented at this moment. I think it would be advisable that you suggest that an amount be appropriated at the earliest possible moment for us to put up temporary structures to accommodate exhibits from time to time. Furthermore, in connection with these structures I think we should have a good-sized piece of ground provided for our use so that we can have auxiliaries to help us out in case of failure in any one department of the decoration of the grounds. For instance, when the summer flowers die I would like to be able to put a million asters in their places in a single night, and we must have ground in which to grow these asters. Thus, like a kaleidescope, we can transform the grounds from time to time. My idea is *progression;* that we should not be tied down to old methods; hence the necessity of material to back us.

In the discussion which followed the exposition of Mr. Thorpe's views, he again remarked: You will understand that the main walks surrounding the horticultural building are to be 50 feet wide, consequently we will have 50 feet in grass, a 50 foot walk, and in some places not more than one foot between that and the lagoon. It is a cruel thing after Mr. Jenney has expended his time on this magnificent structure that it should not be fully decorated. There is no question but the building should be moved back to its original lines.

The following resolution was presented by Mr. Chambers, and unanimously adopted:

RESOLVED, That this committee hereby approve of the suggestion to move the horticultural building back to and beyond the line of the first proposed site It is a magnificent and appropriate structure, but if allowed to remain on the present lines, could not be properly seen. The proposed removal will allow ample space in front for sub-tropical, carpet, and other types of bedding and out-door planting. In the opinion of this committee the proposed change is absolutely necessary.

Mr. Wm. Hamilton then presented the following resolution, which was unanimously adopted:

RESOLVED, That it is the sense of this committee that the sum of twenty-five thousand dollars ($25,000) be immediately appropriated for the erection of the proposed "temporary" buildings, with the understanding that these buildings, although somewhat temporary in their character will be absolutely necessary and in constant use before, after and during the entire time of the exhibition.

At the suggestion of the chairman, Mr. Thorpe outlined briefly a plan of work, as follows:

The ladies are very anxious for the floricultural department to decorate the grounds surrounding their building. In addition to that, we may be asked to decorate the various state buildings. If we undertake this we will have to display all the different forms of adornment according to the architecture of the buildings. I believe in developing our business in that department as far as possible. One of the most important factors in the horticultural business is the decoration of grounds belonging to gentlemen of small means, gentlemen who can afford to decorate an acre, or more or less, as the case may be. My idea would be to have all varieties of decoration, little fruit gardens, vegetable gardens, etc., to surround the buildings in accordance with their architecture, which would show how such things should be done.

Mr. Hill presented the following resolution, which was unanimously adopted:

RESOLVED, That it is the unanimous opinion of this advisory committee that a number of greenhouse structures—the number and amount of space to be determined by the Chief of Floriculture—be erected at once, so that proper care may be taken of exhibits and plants that may be shipped during the next few weeks before the extreme cold weather sets in, said structures to be of a temporary character and to be placed in Jackson Park, with sufficient ground to grow the immense quantities of seedling and herbaceous plants needful for the proper embellishment of the grounds; and to procure a continuous display of flowering plants during the continuance of the exhibition.

Mr. Craig then presented the following resolution, which was adopted:

RESOLVED, That the members of this committee, in their extended review of the grounds yesterday, were fully impressed with the fact that the preparations in the different departments are on an adequate, colossal scale, and they will go back to their towns and the different organizations they represent with the feeling that horticulture and floriculture will doubtless be represented on a scale never before attempted in the history of the world, in entire harmony with the magnitude and completeness of the other departments.

The following resolution was presented by Mr. Craig, and unanimously adopted:

RESOLVED, That this committee desires to extend hearty thanks to Chief Architect Burnham, Landscape Engineer Olmsted, and other heads of divisions for their influence in obtaining the wooded island for the purposes of horticulture and floriculture. Its many advantages are fully appreciated.

John Thorpe.

We are pleased to be able to present in this issue an excellent portrait of Mr. John Thorpe, Chief of the Floricultural Division of the Bureau of Horticulture of the World's Columbian Exposition, from a photograph taken last week.

Mr. Thorpe is so well known to our readers that any details regarding his life and work are hardly necessary, but to the younger men in the trade and those who have not been readers of the FLORIST since its inception, a few general details may be interesting at this time.

Mr. Thorpe was born in 1842, in England, where he received a thorough practical education in all the varied details of gardening, and while very young gave indication of the unusual ability which afterward made him one of the foremost men in the profession. He came to America in 1874 and his position ever since has been in the van of the wonderful advances made by horticulture on this continent in the last three decades.

To him we are indebted for the initial movement that resulted in the organization of the Society of American Florists, the society that has done so much for the advancement of the best interests of floriculture in America, and to his skill as a hybridizer and cross-fertilizer we are indebted for many of the plants that form a large share of the stock of the florists of America today, particularly among geraniums, chrysanthemums and carnations.

He was the first president of the Society of American Florists and has always been an earnest, faithful worker for its advancement.

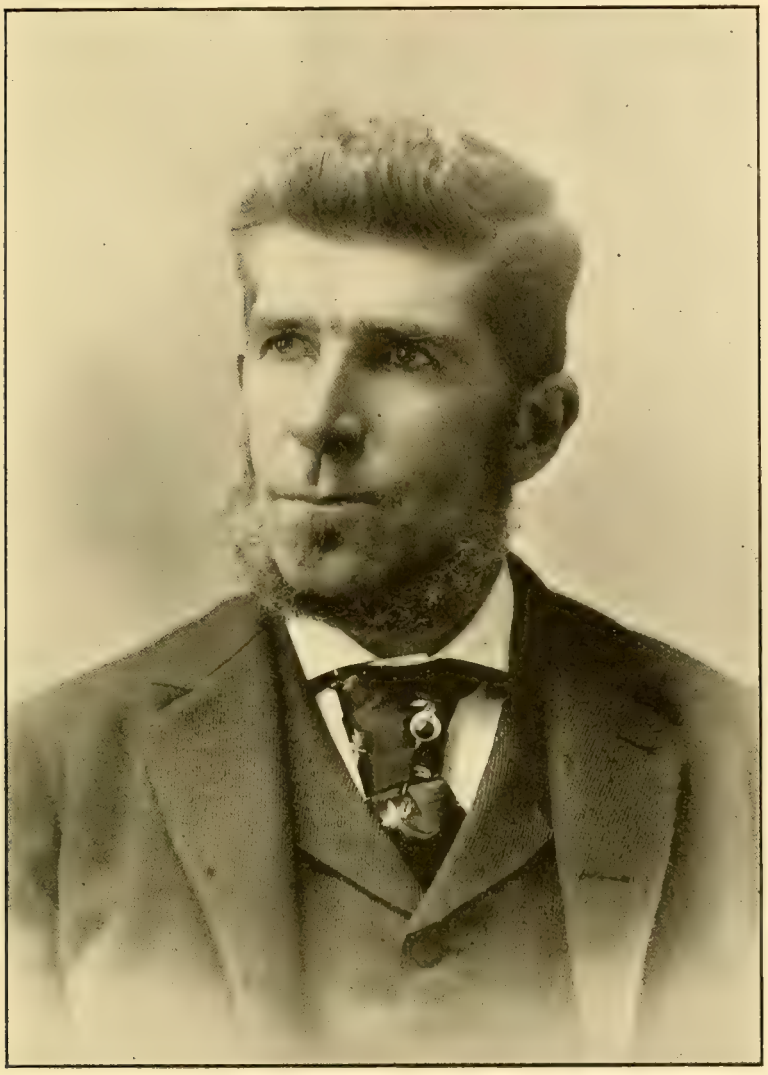
And now he has been selected to direct the destinies of the Division of Floriculture of the great World's Fair of 1893, which position will enable him to give floriculture even a greater impetus than any he has yet been permitted to give it, by making the Division a revelation to the people of America and of the World, of the wonderful progress already made in floriculture, and the magnificent possibilities of the future. And that he will do it none can doubt.

A Banquet.

On Saturday evening the visitors were tendered a banquet by the Chicago Florist Club, at Kinsley's. The decorations were very handsome, the splendid lot of decorative plants contributed by Mr. E. Weinhoeber being most effectively placed, and some Duchess of Albany and American Beauty roses from Mr. O. P. Bassett were magnificent specimens. Occupying a place in front of the chairman was an arrangement of orchids brought from the east for the occasion by Mr. Manda that attracted universal admiration. Our illustration in this issue from a flash-light photograph by Taylor gives a general view of the banquet hall, with the party seated at the table.

As will be seen, the table was arranged in the form of a triangle, which is very advantageous from the fact that everyone at the table faces the others. The space in the center contained a handsome group of decorative plants, and the table itself was decorated with low, loosely arranged plateaus and bowls of roses connected by a tracery of ferns, while the inner edge of the table was draped with smilax. Handsome specimen palms stood in the corners of the hall and in the alcove showing in the center of the background of the picture. To the left from the chairman, whose face can just be seen from behind the central group of foliage, sits Mr. Thorpe, next Mr. Wm. Hamilton, then Mr. Allison, Mr. Chambers, Mr. Dean and Mr. Hill. At the extreme point of the triangle at the left can be seen Mr. Craig, with his chair tipped back a little, and just in front of him is Mr. Manda. Chief Samuels and Landscape Engineer Ullrich are to the right of the chairman, and are hidden by the palms. Superintendent Pettigrew, of Lincoln Park, sat next, and can be seen through the foliage; Mr. Cleveland is hidden by a palm, and at the extreme right is Mr. Vaughan, partly hidden by a vase of roses.

While the photograph is far from distinct, it is certainly very good when the circumstances under which it was taken are considered.



Following we give the various toasts and responses that followed the discussion of the menu, President Grant, of the Florist Club, presiding:

THE CHAIRMAN: Gentlemen, I propose a toast to "The Division of Floriculture of the World's Columbian Exposition," and will call upon its newly-appointed Chief, Mr. John Thorpe, to respond. [Applause.]

MR. THORPE: Gentlemen, it is worth fifty years of my life to be happy once, to be surrounded with this good feeling that has been displayed to me, and I cannot in words thank you enough for what you are doing for me at this moment.

Some eight years ago, in the Sherman House in this city, the Society of American Florists was born. I have been called the father of that society, and if that is so then my friend Mr. Hill is its mother. But however that may be, the society has come to be a power in the land, and now it has given new evidence of its influence by doing what it has for the Columbian Exposition, and I wish to heartily thank you, gentlemen, for what you have done for that great enterprise.

I feel the honor of my position, and think and feel it is the most important event of my life. I want to ask you all, and furthermore I demand from you all, to assist me in making the floricultural part of the World's Fair a success. It depends not only on me, but on all of

JOHN THORPE.

you. I do not care where you come from, I want you to give me all the assistance in your power. I want you to feel that you have just as much interest in making the World's Fair a success as I have. If you think of anything, let me know it; if you can assist me at any time, let me know it. I want you to feel you are just as much interested in what I am doing as I am. In this great undertaking we have no retrospects; we must be progressive. I want to surround myself with people who will say, "I will do for him all that I would do for myself." I want the whole support of all the florists in America. You will understand that it is a delicate position to occupy. You will understand that there are a great many battles to be fought, but I am sure, with your co-operation, that the floricultural department of the World's Fair will be one of the most magnificent successes that has ever been known in the world. [Applause.]

THE CHAIRMAN: Gentlemen, I will now ask you to join me in a toast to a society which has made this gathering possible; a society that has brought into existence our trade organizations in the various cities of the country; a society covering this whole continent with its members; a society as broad in its principles and in its character as any that exists on the face of the globe. Gentlemen, I ask you to join me in a toast to "The Society of American Florists," and I call upon Mr. James Dean, the president of that society, to respond to this sentiment.

MR. DEAN: Mr. President and friends, Mr. Thorpe has stolen a great deal of my thunder in responding to the toast, "The Division of Floriculture." He has told you that the Society of American Florists originated in Chicago eight years ago; that himself, Mr. Hunt, and our friend here, Mr. Hill, and perhaps thirty others formed that society. Most of you all know, in the eight years that have passed, how they have succeeded year by year and the advancement they have made. We are organized as teachers, practically speaking, in the advancement of floriculture. Our society covers, as Mr. Thorpe has told you, the United States and Canada, and we also have a number of members in Europe. We have been called here to assist Mr. Thorpe; he has called a committee of members of our society. We have met here and consulted. You no doubt have seen in the evening papers the result of our consultation and what we did at our meeting here. The principal thing, I think, that Mr. Thorpe wanted us here for was to urge the moving of the building so that we could have a beautiful floral display, for which the location of the building as previously arranged did not give sufficient opportunity. I think that we will succeed, or rather that Mr. Thorpe will succeed in having that building moved back, and if that is done we will have one of the most magnificent shows in front of the horticultural building that the world has ever seen. As Mr. Thorpe wisely remarks, he not only asks your assistance, but he commands it. You must assist Mr. Thorpe in his undertaking through thick and thin, and in no half-way manner. We in the East will assist him with all our might; you in the West, I am sure, will also. If we all do our best there is no doubt that we will have an exhibition here that will far surpass the Paris exposition. The exposition at Philadelphia during the centennial, although grand to our eyes, will be nothing in comparison to the exhibition which we shall hold here. There is no doubt that Mr. Thorpe will receive the financial backing that is necessary. And with Mr. Samuels as the Chief of Horticulture, gentlemen, there will be no failure. Mr. Samuels is certainly a very quiet gentleman, but that he possesses energy and enthusiasm for his work can be readily seen. We want to co-operate with Mr. Samuels, and do what we can to make the floral display a success at our Columbian Exposition. Gentlemen, I thank you for your attention. [Applause.]

THE CHAIRMAN: Gentlemen, I will now propose a toast to "The Bureau of Horticulture of the World's Fair." I want the Chief of this Bureau to understand that he is one of us and that we are willing to aid him in every possible way to make every other division of his bureau a success, as well as that of floriculture. I call on Mr. Samuels, the Chief of this Bureau, to respond to this toast.

MR. SAMUELS: Mr. President and gentlemen, it gives me very great pleasure to meet the representative florists of Chicago, and the most prominent men in the profession from other large cities of our continent. It is especially gratifying that we have met on this occasion to do honor to my warm friend and associate, Mr. John Thorpe. [Applause.] The fact that our visitors have laid aside their business to come hundreds of miles to advise and consult with him is an evidence that they have a deep interest in the success of the floricultural division of the horticultural department. It is upon you visitors and the local florists of Chicago that the great burden will fall of furnishing material for the greatest exposition, we hope, that the world has ever seen. Did not Mother Eve gather posies and delicate raiment, figuratively speaking, in the Garden of Eden? No doubt Eve reclined on floral beds of ease, and Father Adam surrounded the garden wall with a cordon of policemen to intimidate the kodak man You have promised your hearty co-operation, and we know that means success in advance; that your representative plants will be gathered from every country and every zone, and, what is better, hybrids, crosses and imported varieties, the result of your own toil, patience, intelligence and skill will be exhibited. You have looked over the grounds allotted to the horticultural department and seen the plans of the horticultural bureau, and we hope you are pleased with them, and when you return home we sincerely hope that you will carry with you as favorable an impression of the exposition as you have left with your friends. I thank you, gentlemen. [Applause.]

THE CHAIRMAN: Gentlemen, only a short time since, when we met at Toron

to, a modest gentleman appeared there, and announced that he had been commissioned to represent the World's Columbian Exposition, and invite the advice and confidence of the members of our national society regarding the floricultural division of the World's Fair, and he at once won the confidence of those with whom he came in contact. I refer to Mr. Allison, chief of the Bureau of Manufactures of the Fair, whom I am pleased to say we have with us to-night. I will now propose a toast to "The Greatest Exposition in the History of the World," and will ask Mr. Allison to respond.

MR. ALLISON: Mr. Chairman and gentlemen of the Chicago Florist Club and the visiting brethren from abroad, I can scarcely express to you my feelings of satisfaction for the honor conferred on me by an invitation to be present with you this evening to do honor to one that you all venerate. I refer to Mr. Thorpe. [Applause.] I am free to say that it did not take me long to discover that fact after I had landed in Toronto. I did not visit Toronto as a professional florist or a scientific botanist, or as knowing anything about horticulture, but I do confess that I now know the difference between a hollyhock and a sunflower, and my good friend has been talking to me so much since I came home, and so everlastingly drumming in my ears this idea of crossing, that I have got in my mind the idea that I can cross the hollyhock with the sunflower, and I have gone so far as to plant some seeds in my back yard, and I will tell you in the spring how I succeed. But, gentlemen, in all sincerity, I want to say to you it is one of the pleasures of my life to have become acquainted with, and although the acquaintance was short to have formed attachments for, the intelligent body of men composing that society of florists that I had the pleasure of meeting in Toronto. As regards the World's Fair, gentlemen, those of you who are here know all about it, as much, perhaps, as I do, although I think that there is no one who is not directly connected with the great work that has the faintest idea of its magnitude. They may go out and gaze over the ground, and see the vast preparations being made there in the various departments and the necessary work pertaining thereto, but there is no one, unless he is closely identified with it, that can have the remotest idea of its magnitude. I have had some experience with enterprises of this kind before in a small way, but never with a building which has been assigned to cover the department of manufactures. You gentlemen know the area of an acre of ground; multiply that one acre by 32, and you have the outline of a single building about to be constructed for manufactures; 32 acres of area under one vast roof; the main or central feature 387 feet in width by some 1,800 feet in length, covered by an arched roof of steel and glass. The entire width of the building is to be about 800 feet and including the galleries surrounding the interior we will have about 47 acres of exhibiting space. The other buildings will be equally as large proportionately for the purposes for which they are designed. There are a half a dozen new departments incorporated in this great work that have never been undertaken before, or any other similar work of the kind, notably transportation, electricity, appliances, etc. I have no doubt that before they get through with this great work they may, perhaps, cover the entire Washington and South Parks, as well as Jackson Park. All those that are strangers here I know will be at this great exposition; it will be a magnet so keen that you cannot remain away. I thank you, gentlemen, for your attention, and I thank you once again, Mr. Chairman, for the privilege of being here and paying my respects with you to your honored guests. [Applause.]

THE CHAIRMAN: Gentlemen, we have with us to-night the second president of the Society of American Florists. He lives in the City of Brotherly Love. And by the way, gentlemen, I want to say that that name is not misapplied. We have with us from that city, gentlemen, one who has not only been the honored president of our national society, but is the present executive head of the Florists' Club of Philadelphia; I refer to Mr. Craig. [Applause.] He is familiar with many of the details of the Centennial Exposition of 1876, from which we expect to learn many useful lessons in the conduct of this exposition, which we hope will excel anything in history. I will call upon Mr. Craig for his experience in connection with the horticultural department of the Centennial Exposition, and any lessons therefrom which may occur to him as useful to us.

MR. CRAIG: Mr. President and gentlemen, it certainly affords me very great pleasure to be present here to-night at a representative gathering of this character. I see around me earnest, thoughtful men who are identified with every branch of horticulture and floriculture, men who have made the city of Chicago famous in certain departments of outdoor decoration which are recognized to be unequaled anywhere on the face of the globe. Now, gentlemen, I only regret that in a gathering of this kind I can give you but very imperfect and incomplete impressions of that Centennial Exposition. I recollect that it was considered at that time the grandest exposition of human industry that had ever occurred in this country and perhaps in the world. We had there the product of the mine, the field and the factory, the delicate workmanship from China and Japan and the most intricate examples of mechanism that had been shown up to that day. All these things are matters of history; they can be referred to in the books of reference and they will be educational for many years to come. But I suppose now you are chiefly interested in the branch of horticulture as it was exemplified at that time. I regret to say that while it was in some respects very interesting it was inadequate and incomplete, and chiefly so because the work connected with it was started at too late a day, and therein lies the first lesson for the Columbian Exposition. I am glad, gentlemen, that you have gotten to work so early and under such favored auspices. You have gotten for your Chief a man who will go into this thing with his whole heart and his whole soul and there is a good deal of heart and soul in John Thorpe. [Loud applause.] I have no doubt it would have been perhaps better to have started some of the departments a year earlier, but it is well that it has started now and started so favorably. I recollect that the main regret among the workers at the Centennial Exposition at the last moment was that they had not begun two years before to gather from all parts of the world the examples of vegetation that they wanted to show. They regretted at the last moment that they had not sooner awakened to the possibilities of the occasion, but it was too late. We might have sent a capable man to Cuba to gather there thousands of examples of those wonderful crotons, 30, aye, 50 feet high, like shade trees. What a magnificent representation of vegetation Cuba could have had if the authorities had started a capable man down there 18 months in advance to gather those things together for that exposition. That must be done here. You have learned that lesson.

Another mistake that was made at the Centennial Exposition was in bringing the tree ferns from Australia. One of the first problems that struck the projectors of the exposition was how to get together plants of adequate size to fill that building. Plants such as we have here in this country were insignificant compared with the height of that building and the idea was conceived to send to Australia for tree ferns and there were some brought here, the largest 32 to 33 feet high. About 50 of these plants were brought, but unfortunately the vessel on which they were shipped was wrecked; it shipped salt water and the tree ferns were all destroyed except half a dozen. That half dozen plants grew well enough to show the directors of the Columbian Exposition the possibilities of these tree ferns, if they take it in time and see they are safely brought here. You can go to Australia, gentlemen, and get these trees 70 feet high. It is quite practicable to bring them here alive. I imported from Australia some tree ferns fifteen feet high. They arrived at my place about the middle of September and this last June I sold them in New York with heads eight to ten feet in diameter, just in two-thirds of a year. Now, gentlemen, you are in time for all these things, you have got your chance. If you will send out the proper man to bring these examples here you can show the people such plants as they have never before had an opportunity of seeing, even the practical horticulturists among you have not seen such examples as should be gathered together in that grand structure you are about to erect for the World's Fair.

The president has asked me to refer to special features that were of interest in the horticultural department. As I have said, many features were inadequate, but there was one there that was the feature of the show and that was the rhododendrons exhibited there by Mr. Waterer, of England. They covered a space of about 60 by 60 feet; it was one of the greatest attractions in the show. Instead of covering a space 60 by 60, you should cover perhaps ten times that amount with rhododendrons in this exposition. Such a treat they will be to the people that I cannot conceive of anything more magnificent. There was a very poor attempt at the Centennial Exposition at an aquatic display. Since that time aquatics have grown in favor and their culture has been advanced exceedingly. There is an opportunity there in the water around that exposition ground to make such an exhibition of aquatics as the world has never seen. Our hot summers here are admirably adapted to some varieties and such varieties as require heat your steam facilities for the exposition will afford ample supply.

Now, gentlemen, I am not going to detain you all night; there are a number of gentlemen here we want to hear from; but I cannot close without one thought. This exhibition has been started in the proper way. The gentlemen in charge of this fair have grasped the situation. We gathered that much in our extended tour of the grounds yesterday. They have not taken any narrow view of the situation, they have taken it in a broad way and we have started a song—a song, gentlemen, that you can all join in the chorus—

BANQUET TENDERED TO MR. JOHN THORPE AND THE COMMITTEE OF THE SOCIETY OF AMERICAN FLORISTS, BY THE CHICAGO FLORIST CLUB, SEPTEMBER 12.

the refrain of which will extend to the uttermost parts of the earth and will bring the people here from all quarters of the globe. In olden times it was said that all roads led to Rome; but in 1893 all roads will lead to Chicago. [Loud and continued applause.]

THE CHAIRMAN: Gentlemen, but a short time since it was the privilege of a great many members of the Chicago Florist Club to receive, with the other members of the Society of American Florists from all over the United States and Canada, the hospitality of our Canadian brethren. Gentlemen, we found that over the line there were as warm hearts as ever beat. I want to say, gentlemen, that when we crossed the line, at the north of us we found another city of brotherly love. I know that you will join me most heartily in a toast to the florists of Canada, and I will ask Mr. John Chambers to respond.

MR. CHAMBERS: Mr. President and gentlemen, I thank you heartily on behalf of the florists of Canada. I feel a little diffident in getting up to make a speech to you, for when I came into the building I was introduced to one of the Chicago florists as a foreigner. Gentlemen, do I look like a foreigner? [Cries of no, no.] If I look like one I do not feel like one among my friends here; I can assure you that I feel perfectly at home.

In speaking of your World's Fair I may say that when the exposition was first talked of on the continent of America I really thought that Chicago had a good deal of gall, if I may put in in that way, to think of holding the World's Fair here. I thought New York without doubt was the biggest city on this continent, as I had seen New York at that time, but, gentlemen, I must confess I had not seen Chicago. I will say this: Having seen your city, seen its magnificent buildings, seen its grand streets and its wonderful parks, that I really wonder now that New York ever had the audacity to think of holding the World's Fair there. [Laughter.] I remember some years ago, gentlemen, seeing probably what was then one of the finest horticultural exhibits ever held in the world. It was called an International exhibit and it was held in London, England, in 1866. It was then thought to be one of the largest and finest exhibits of horticultural products, and no doubt it was at that time the finest that had ever been gathered together. That building, if I remember right, or as I have read since, covered some two acres and a half of land, and that exhibition was magnificent. But when you compare two acres and a half with the magnificent building to be erected by your people in Chicago, which covers about eight acres of land, it sinks into insignificance. Not only that, the surroundings of the grounds to be decorated by the floricultural department is to consist of some 40 acres. You have a task before you. You have not only those grounds, but as I understood in going over them with Mr. Samuels and Mr. Thorpe, that it is the the intention of the horticultural department to decorate and embellish the state buildings. I tell you, gentlemen, it is a work of magnitude; you will have to look to your laurels. I would like to see it a success and it will no doubt be one. I may say as far as I am concerned that for the country from which I come, Canada, I am sure the people will do their utmost to assist you and they are enthusiastic, I believe almost as much so as the Americans in regard to the World's Fair. [Applause.] It is one thing we feel, gentlemen, and that is that this is not going to be a Chicago fair, it is not going to be an American fair, but a fair for the whole of the world, as the whole of the world will be represented. I may say that a great many of the American people have a very vague idea of what Canada is like. Gentlemen, we have a great country, we have a magnificent country, and I think you will find that when our display has been made in the horticultural department and in other departments that we are not so far behind as a great many think us to be. While we perhaps cannot show such magnificent parks, cannot show such magnificent buildings, there are some good things in Canada. There is another thing, gentlemen; I am not going to speak for the whole of Europe, I am going to speak for that little country whose flag I live under, that is England. I think you will find that the British Empire will take hold and help to make the World's Fair one of the greatest successes ever known. When a city like Chicago, which has the ground and the dimensions it has, takes hold of a thing, its success is assured. I thank you for the toast and I shall not forget when I return to Canada to acquaint them with the royal reception I have received here and I hope, gentlemen, it will not be the last time I shall have the pleasure of meeting you. [Applause.]

THE CHAIRMAN: Gentlemen, we have had speeches from the heads of departments of the Fair, from visitors and others, and I want to call now upon a gentleman we have with us tonight, whose work will be in a large degree a foundation for these Chiefs to build upon, and without this foundation their work would amount to but very little, able men as they are. I desire, gentlemen, to call upon Mr. R. Ullrich, the engineer in the landscape architect's department, to respond to the toast "Landscape Art in America."

MR. ULLRICH: Gentlemen, let me thank you for your kind reception. I always took great interest in this society and I am not suprised to see it a success. [Mr. Ullrich spoke in such a low tone of voice that the stenographer was unable to catch his further remarks.]

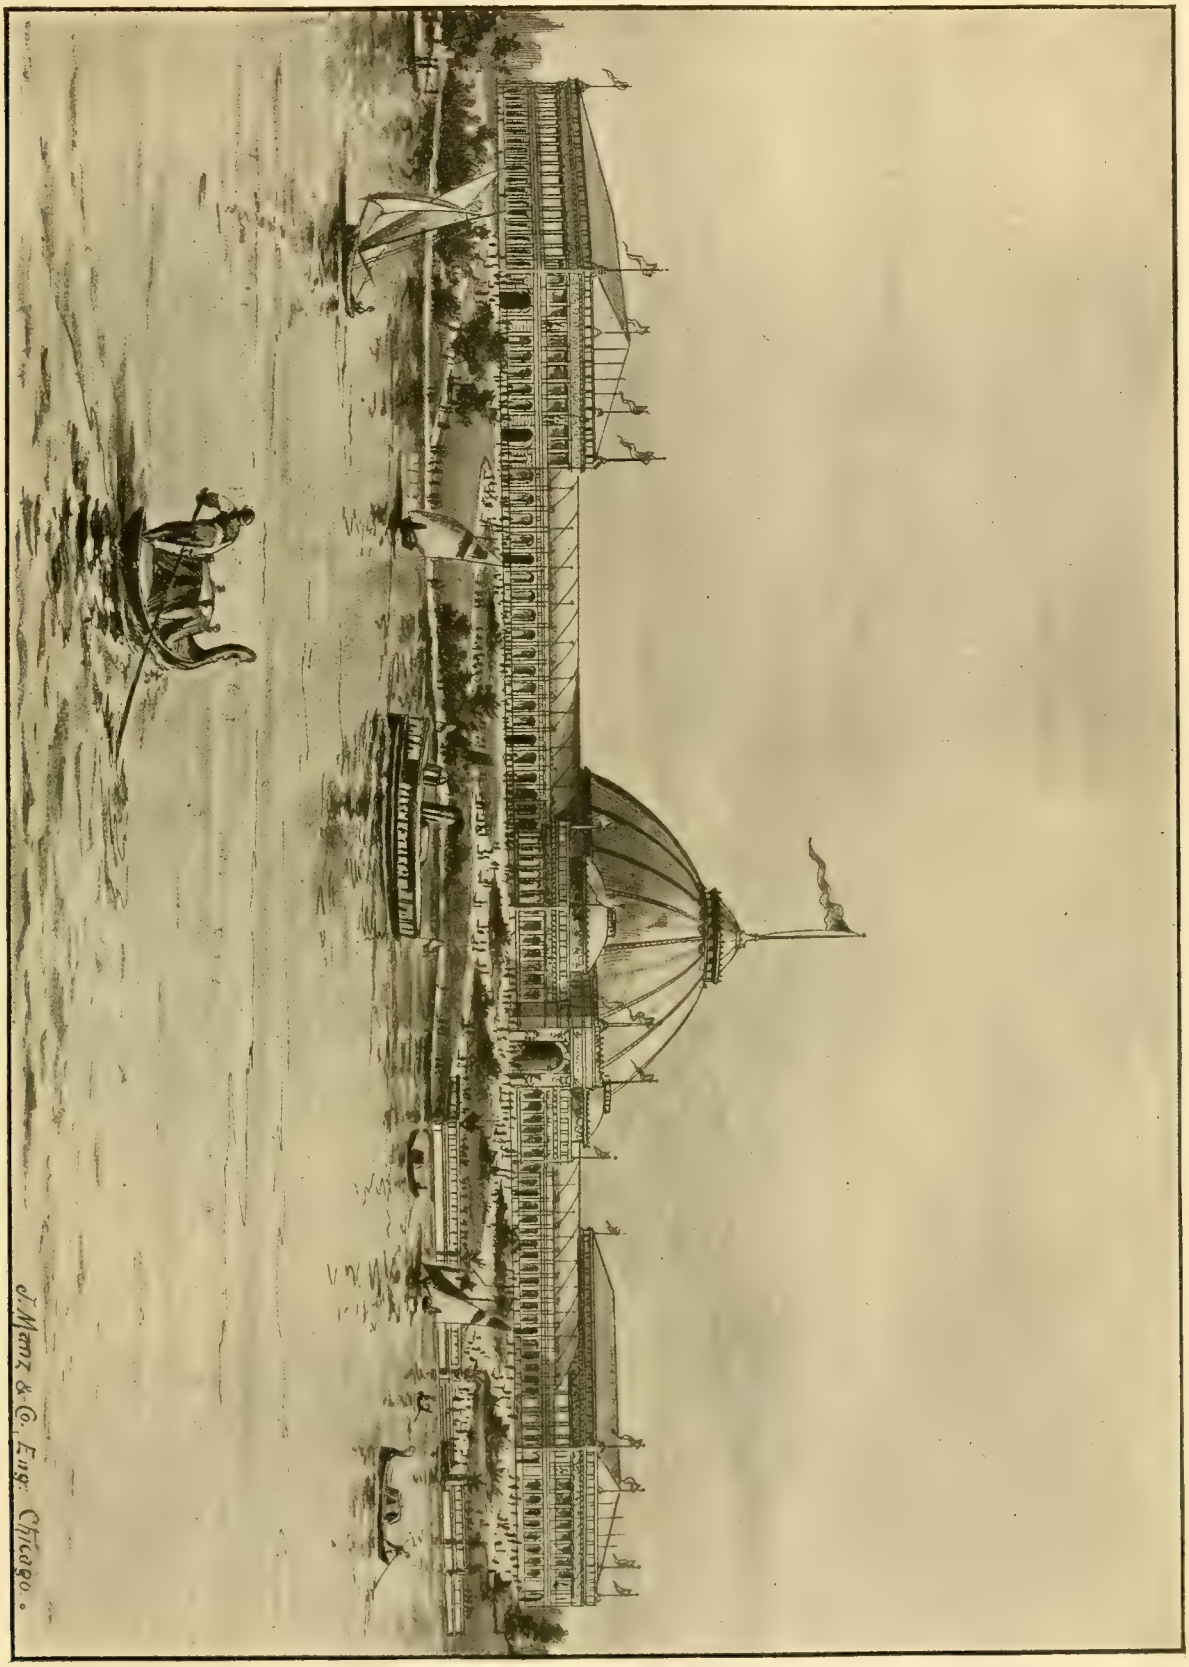
THE CHAIRMAN: I am sorry we did not have more from Mr. Ullrich. If there are any here that do not know what he has done, I want to say that he has accomplished a most wonderful work, especially upon the Pacific coast, where he has done some work that cannot be excelled in its line. I am sorry that he did not give us a more extended response.

[The Chairman here called on Mr Chambers for a song, who in turn invited Mr. J. D. Coulthard, of Toronto, who sang "The Warrior Bold" and on encore recited a historic address entitled "Spartacus".]

THE CHAIRMAN: Gentlemen, I ask Mr. E. G. Hill, of Richmond, Indiana, to respond to the sentiment, "Foreign Horticulturists at the Fair."

MR. HILL: Mr. Chairman and gentlemen. We know that Chicago has got to be the Mecca of the floriculturists of this country and I opine and believe that the horticulturists and the nurserymen and seedsmen of Europe will also find their footsteps wending this way in 1893. Chicago is a wonderful city, as Mr. Chambers has told you; wonderful in a great many ways. There have been some wonderful things accomplished here in Chicago that every florist in this country should be proud of. Mr. Thorpe very modestly referred to the part he took in the organization of the Society of American Florists. He need not be at all modest about that, we all grant that he was the Father of that Society. We all know that Mr Thorpe is fruitful in great things; fruitful in giving us ideas and cultural directions regarding plants, and it is out of the great breadth of his noble brain, that the Society of American Florists was born, and many gentlemen, not mentioning myself, helped to rear the child after it was born. But I am digressing somewhat. I was going to say that Chicago had produced something else. It has produced a paper that has been a wonderful benefit to the florists of this country, in that it has spread broadcast throughout this land, knowledge of plants and of floriculture. It has, in fact, performed a great mission and that paper had its being here in the city of Chicago. I think that if the Society of American Florists and this great paper that we are all proud of, will take hold of this matter and represent to the horticulturists of Europe, Japan and China, the great things that are being prepared here for this exhibit floriculturally and horticulturally, that there will be no trouble in getting a magnificent exhibit from over the waters; in fact it has been intimated by a gentleman who knows, that the bulb growers of Holland will be here with millions of their bulbs and they will be seen in all their beauty on the grounds of Jackson Park. We want to see the men of France here with their new plants, we want to see the men of England with their plants, and I think it should be the mission of the Society of American Florists acting in conjunction with the officers of the World's Columbian Exposition to induce those men to make exhibits here. I think if we could introduce to the horticulturists of Europe these genial gentlemen who are at the head of the undertaking; if we could have them shake hands with Mr. Allison and our friend Mr. Samuels and Uncle John, they would all come *en masse* and bring everything they have over there with them. It has got so very late and I have so many thoughts crowding in upon my mind, that I think I had better give way, as "Blue Jeans" used to say, to some more able man.

[Mr. Wm. Hamilton, Superintendent of the Allegheny City Parks here responded to the sentiment, "Large decorative plants at the Fair." But as he spoke in a low tone the stenographer caught only a few sentences. He named owners of large plants who would contribute same to the fair, mentioning specially, Messrs H. H. Hunnewell of Wellesley, Mass., Geo. W. Childs of Philadelphia and a Mr. Brown of St. Louis, and spoke enthusiastically of the gigantic specimens that could be brought from their native wilds.]



THE CHAIRMAN: Gentlemen, we have with us tonight a distinguished member of the profession, Mr. Manda, of the firm of Pitcher & Manda. There will be a great many important special features at the Fair. Mr. Manda is nothing if not original, and with that knowledge I have assigned him the sentiment "Special Features for the Fair" and will ask him to respond.

MR. MANDA: Mr. President and gentlemen present. The subject assigned to me has been partly discussed by the speakers, but there may be a little left yet. You know that water finds its level and if you look into history you will find that everything from the beginning of the world up to now has been a struggle and it has always resulted in the survival of the fittest. When the matter was broached about celebrating the 400th anniversary of the discovery of America, there were several cities, a few towns and some villages that were aspirants for the honors of holding such an exhibition. It came that the city most fitted and most worthy of such an honor was selected as the site of the exposition. The next thing was the division of the several departments. It came to the very important department of horticulture and of course it had to be filled by a man that was eminently fitted for the position, and you found that man in Mr. Samuels. The next thing was the branch of floriculture, and then the best man loomed up from the East in the person of Mr. John Thorpe. Coming to the special features; they should be worthy of that exposition, which is of such magnitude, that until I received your circulars I had a very faint idea myself what it was going to be. There is an old saying that "Charity begins at home". If you want to make a display worthy of the Columbian Exposition, I would advise you to make a gathering of our native plants; make such a gathering that it will be superior to any other collection ever made, and present it down in your spacious grounds. I mean native plants that grow from Maine to Florida and from New Jersey to California. In regard to aquatic plants, you have the water and you need not go out of the limits of your city to look for the plants; for, looking over your parks I must say that I never saw such a splendid exhibition of water lilies before. Another very interesting group, which is always admired, I would suggest is a group of economic plants. Everybody wants to know what we eat, what we drink, and what we take for medicine. Today we have some 500 species, and before the World's Fair closes its doors we will think we cannot have too many. Gentlemen I thank you for your patience and interest.

THE CHAIRMAN: We have heard from each one of our visitors and I am sure you have very thoroughly enjoyed their remarks. We will now listen to some of our home talent. We have some men here in Chicago that can talk a little; I believe you heard of them down in Washington some time ago. We have also in Chicago some horticulturists that we feel we owe a great debt to. In Chicago nothing has been progressing more rapidly for the last two or three decades, than gardening. You recollect the old saying of Bacon that "Men come to build stately sooner than to garden finely." Chicago has reached that stage where it has stately buildings, and is now preparing to garden finely. I will propose a toast to the Chicago horticulturists and will call upon Mr. J. C. Vaughan to respond.

MR. VAUGHAN: I am glad that you called on me to say something of Chicago horticulture, for if you had simply given me the word Chicago I should not have been able to have touched it at all. I may surprise the gentlemen here, but there is an old saying that has been running in my head tonight and it goes about like this: "Let him not boast who puts his armor on, but rather he that takes it off the battle won." That battle, as Mr. Chambers has said to you is about to come, and if it comes to anyone I think it comes on many of us local people. Gentlemen, I look upon this evening as the beginning of the horticultural work, I cannot consider it as anything else. There has been strife, there has been sectional feeling, there has been long delay, but, gentlemen, I feel I voice the sentiments of the local people when I say they are ready to begin now and forget. I believe that I state the fact when I say as Mr. Thorpe has said, that the display in this department, this grand show, is not to be a retrospective one. We are not going back to what has been up to this time in the year past, and I feel more assured of that when a man like Mr. James Dean, the most conservative representative of the best element in New York, that great commercial center of our trade, comes before you and makes the speech that he has made tonight. Gentlemen, this is not an idle boast, coming from a conservative man like Mr. James Dean, your president. I say further, that when a man of the standing of Mr. Craig of Philadelphia, one of the foremost cities in floriculture in America, if not the foremost, speaks in the enthusiastic way he did here tonight predicting the success of this Fair it shows that the East is with us now.

I am not, as I said intending to say anything about the greatness of Chicago; Chicago men have spoken about that enough, although they did not dare to tell half what they thought. There has been an intimation that this may be a Chicago fair; I do not believe it, I think it will be an International fair, where Chicago is the host. I speak now horticulturally and I believe I can speak generally

THE HORTICULTURAL BUILDING FOR THE WORLD'S COLUMBIAN EXPOSITION OF 1893.

as well that Chicago is the host in this fair and you will see that she will be the host and it will be her pride and glory to see that her visitors are given the front ranks.

Mr. Paul Hull, of the Department of Promotion and Publicity, responded on behalf of "The Press," and furnished much entertainment by relating several very humorous stories in an inimitable way; Mr. M. F. Gallagher responded for "The retail florists," Messrs. Wm. Hamilton and Edgar Sanders favored the company with songs, and Mr. Craig sang "Annie Laurie". Then the whole party rose and sung the Chicago Florist Club's song, and they made the hall ring. The evening's entertainment closed by all joining hands and singing "Auld Lang Syne," the visitors led by Mr. Manda, giving three rousing cheers for their entertainers. All present voted the evening a most enjoyable one.

Horticultural Building at the World's Fair.

Sometime since we presented an engraving of the Horticultural Building for the World's Columbian Exposition, the same being a reproduction of the architect's drawing. We are now pleased to be able to present a fine half-tone plate, showing much better perspective and making a better picture. This beautiful building, whose magnitude may be understood

from the fact that it is 1,000 feet long, will be the home of horticulture at the great Exposition. It is a grand building—all that the horticulturists of America could ask—and there is no question that the Division of Floriculture will receive the proportion of space its importance as an exhibition feature merits.

Cemetery Superintendents Meet.

If anyone has an idea that cemetery superintendents are a melancholy set of men they would have had this idea immediately removed had they attended the fifth annual convention of the Association of American Cemetery Superintendents, held at Chicago last week. While dignified and earnest in their work the members of this association are as genial a lot of men as one would wish to meet and there was no lack of wit and repartee in the discussions of the various subjects brought before the association.

There were about seventy members in attendance and as the total membership is 123 it will be seen that the proportion in attendance was very large.

President Barker's annual address was an able effort. He indicated the good results that have attended the work of the association, suggested many reforms and improvements and recommended still further directions in which effective and valuable work might be done. It was well received and Mr. Barker's work for the association and his eminent abilities as a presiding officer were afterward recognized by re-electing him for another term.

The programme of essays and discussions was carried out as printed with but two exceptions. Following is a list of the essays presented, each being read by the author and afterward discussed by various members:

"On the Boston Meeting," by C. W. Hamill, "Mt. Olivet," Baltimore; Perpetual Care of Lots," by J. W. Lovering, "Mt. Auburn," Boston, and T. McCarthy, "Swan Point," Providence; "Should Cemeteries present more of Nature and less of Art?" by G. H. Scott, "Rose Hill," Chicago; "Cemeteries Historically Considered," by Charles Nichols, "Fairmount," Newark, N. J.; "The Business Management of Cemeteries," by F. W. Higgins, "Woodmere," Detroit.

As showing the scope of the work of the association and how large a part of the work of cemetery superintendents comes within the bounds of horticulture we append a list of the questions submitted for discussion. Had one dropped in at certain times during the meeting, without knowing the name of the association, he would have been speedily convinced that he had entered the meeting of some leading horticultural society. Here is the list: How to secure a dark velvet lawn and when obtained how to preserve it? What substitutes can be used for lawns? Lawns under trees; What lawn mowers are best? How can we get rid of plaintain and chickweed? What fertilizers are best? System of book-keeping for care of lots; Instruments needed in laying out a cemetery. Best tent to cover grave in wet weather; Hitching posts—design and location. The best size for burial lots; Corners for lots and sections; What plants and shrubs will do well in a climate varying in temperature from 45 to 105 degrees? Is fall the best time for transplanting trees and shrubs?

It is indeed gratifying to know that horticulture occupies so large a share of the attention of those in whose hands the care of cemeteries rests, and that every year cemeteries are presenting "more of nature and less of art."

No less than 19 new applications for membership were received at the meeting and as all were elected, 19 new names were added to the membership roll.

Officers for the ensuing year were elected as follows: President, J. G. Barker, "Forest Hills," Boston; Vice-President, Wm. Salway, "Spring Grove," Cincinnati; Secretary and Treasurer, Frank Higgins, "Woodmere," Detroit.

The next convention will be held at Baltimore at about the same dates that the Society of American Florists meets in Washington, the exact days being left to the discretion of the executive committee.

But business was not the only feature of the convention. While business was strictly attended to in the mornings, the afternoons were devoted to pleasure, and the local superintendents entertained right royally.

On Wednesday afternoon, piloted by Superintendent Shepard of "Oakwoods," the visitors proceeded to the beginning of Drexel Boulevard, where park phætons were in waiting for the party. Then they were given a ride through the South Park system, stopping to view the work going on at the World's Fair site, and then proceeding to "Oakwoods," where after a ramble through the grounds they were invited to a splendid lunch.

On Thursday afternoon Superintendent Scott entertained the convention in much the same way at "Rose Hill," the party going by rail, and on Friday Superintendent Simonds of Graceland extended the hospitalities of the management of that cemetery. And after a view of the grounds and lunch, park phætons conveyed the party to Lincoln Park. It was already dark, but the park is a beautiful sight at night, lighted as it is by a system of electric lights, and the party much enjoyed a view of the famed electric fountain in full play.

All heartily enjoyed themselves and the Chicago convention of the association will undoubtedly be long remembered by all who were so fortunate as to participate.

We must not omit to mention the fact that Mr. Charles Nichols, of "Fairmount," Newark, N. J., the "father" of the society, was present, and rejoiced in the present splendid proportions and strength of the "infant" he and a few other enthusiastic men brought into existence at Cincinnati in 1887.

The local committee were the recipients of many expressions of gratification from the membership at the cordial reception accorded, and they were certainly entitled to all the credit given them. But what Simonds, Scott and Shepard can't do when they get their three S's together wouldn't be worth attempting.

Convention Thoughts.

It is to be regretted that so many valuable papers are passed over without discussion. It is certainly not an unqualified compliment to the author of an essay to give him a vote of thanks, coupled with the assertion that his dissertation is "so complete and covers the ground so well that it needs no discussion."

Many of the Toronto papers bore evidence of careful preparation, and their literary as well as their practical value was fully equal to those presented at any previous meeting. Much valuable time had evidently been given them by their authors, who in many cases are very busy men and their time is precious.

To pass them by as was done at Toronto and at Boston is almost a discourtesy, and will be but poor encouragement to effort on the part of future essayists. If the subjects selected for presentation at these meetings are such as do not awaken any interest in our members, why do they not suggest better ones? The executive committee will surely thank any of the members for suggestions as to matters worthy of discussion, or for any plan whereby an interchange of opinion in our meetings may be encouraged.

Some complaint has been heard regarding the delay in opening the sessions, the meetings being called to order sometimes a half hour or nearly a whole hour after the advertised time. The remedy for this lies with the members individually. At the Toronto convention there was not a session when the president and secretary, as well as the essayist, were not on hand ready to proceed at the advertised hour. But where was the audience? To call upon an essayist to stand up and read a paper to an empty hall is not exactly courteous or agreeable, but the chairman must do that or else wait until the audience materializes.

State delegations do not take that interest in the election of their state vice-presidents which they should. In fact, very few of them take the trouble to elect anyone, but leave it to the president to appoint him. The result is that in many cases gentlemen are given the honor who take not the least interest in the society's welfare, who do not attend the meetings regularly, and who cannot be induced to give a moment of their time to any work which the position entails. It should be the pride of every state to be represented in the society by as large and influential a delegation as possible, and there is no way to accomplish this result so well as to elect a vice president who can and will make some effort to have his own state make as good a showing as possible.

W. J. S.

New Plants in Canada.

In justice to our Canadian brethren let me note a few of the new plants raised by them and brought to our notice at the convention. Long before the convention I placed myself in correspondence with some of the prominent florists there regarding any new plants they might have among them and asked that samples of the plants together with descriptions of them be brought to the Queen's Hotel and submitted to the Committee on Nomenclature on Monday, the day preceeding the opening of the convention and this they cheerfully did.

And to Mr. J. H. Dunlop I especially tender my thanks, for he promptly, fully and cordially answered my every question about new plants, hotel and railroad arrangements, etc., in fact did everything he possibly could to aid us before we went to Toronto and help us after we got there.

I regret exceedingly that I have been unable to get any information about the new plants that were sent to Toronto to be grown for trial or comparison; to my letters regarding them no answers have ever been received.

ROSE TORONTO is the golden-flowered form of Perle des Jardins raised and grown by Mr. J. H. Dunlop of Toronto, and which was seen at home growing and blooming and in fine condition last January by the executive committee of the S. A. F., who admired it and eulogised it unstintedly. "The habit is dwarfer than that of the Perle, but the growth is very robust and almost always there is only one blossom to the shoot; flowers large, deep golden yellow deepening in the

SPECIMEN PLANT OF LIVISTONA CHINENSIS (LATANIA BORBONICA.)

center in open flowers to soft rosy pink; foliage distinct from Perle, larger and deep blood red on youngest wood like Sunset. It is a profuse bloomer and in winter almost free from bull heads."

A TRICOLOR-STRIPED VARIEGATED LEAVED CANNA raised by Mr. McPherson of Toronto and now handled by Mr. Gilchrist of West Toronto Junction, appears to be a very promising variety. As all of the plants that we saw were greenhouse grown their variegation was paler than would have been the case in outdoor specimens. Nevertheless it looks well and promises to be better than the variegated Warscewiczii or any other variegated leaved canna yet on the market.

COTYLEDON (ECHEVERIA) JOHN COTTERILL, a beautiful and highly tricolor-variegated dwarf form raised by Cotterill Brothers, Toronto. Their description: "In growth similar to E. secunda glauca, the main stem is delicate pink, the leaves have a pale green center varying from white and pink to a deep carmine at the edge." Wherever mosaic or carpet bedding is in vogue or succulents are used in flower gardening in any way this little beauty must find a place.

MANTON'S SEEDLING ECHEVERIA is a glaucous green variety raised in 1881 by Manton Brothers of Toronto, from seed of E. metallica.

MANTON'S FERN.—This is a seedling fern which originated with Manton Brothers, but its parentage is unknown. It is an elegant fern. The raisers' description: "Habit like Pteris tremula and appears to have some of the characteristics of P. serrulata; fronds 2 to 3 feet long, branched and divided, the ends of the pinnæ running out long like those of P. serrulata and sometimes crested; a good grower."

Specimen Livistona Chinensis.

Livistona chinensis (synonyms: Livistona mauritiana and Latania borbonica.) The last named synonym is the more popular name. How valuable this palm is for decorative purposes is patent to all engaged in our business. Perhaps no man has done as much good in distributing it as Mr. Wm. R. Smith, of Washington. He told me that 28 years ago he sent among other plants about a dozen seedlings of this from 2-inch pots to a gentleman in the south who was aspiring to garden decoration. The plants arrived safely, as acknowledged by letter, but the gentleman wanted to know "what the deuce did you send corn for?" Some of those plants are to-day 35 feet high and as much in diameter.

The illustration shows a grand specimen of this noble palm exhibited at the last spring show in New York. It was grown by that clever plantsman, Gus Bennett, gardener to W. Brown, Esq., of Flatbush. It is safe to state that no more perfect specimen was ever exhibited. The height was 14 feet, the diameter the same, and the plant had twenty-seven perfect leaves.

JOHN THORPE.

Greenhouse Rhododendrons.

Under this heading are now included a large number of species and varieties, some of these being of Indian origin, while many others are the result of hybridization. Considerable variety in coloring is also found among them, ranging from bright crimson through the intervening shades of red and pink to pure white and from orange to pale yellow.

The culture of Indian rhododendrons is not specially difficult, as most of them will flourish under the same treatment as azaleas, a similar soil being usually favorable for their growth, while a temperature of 45° to 55° will prove satisfactory for most of the species, though during the summer the rhododendrons will be benefitted by a little more shade than is essential for the azaleas.

Propagation is usually effected either by cuttings, by grafting, or by means of seeds, the first method being probably the most used.

The cuttings should be made from firm young growths, and generally root sooner if taken off with a heel of the old wood attached, the treatment necessary being the same as that given to azalea cuttings.

Among the notably good sorts is R. Countess of Haddington, a hybrid variety of strong growth and large foliage, and the flowers of which measure from three to four inches in diameter, and are bluish white in color.

R. ciliatum is another pretty species, though much smaller in growth than the preceding, and produces clusters of four to five light pink flowers. This species is said to be hardy, but perhaps may not be so north of Washington.

R. Edgeworthii is another fine old sort, though possibly a little more difficult to increase by means of cuttings than are some of its relatives. The leaves of this species are quite wooly on the under side and of medium size, while the flowers are nearly four inches in diameter, almost white and very fragrant.

R. Jasmiflorum is also a good species, having comparatively small foliage, and producing its flowers in umbels or trusses containing a dozen or more blossoms, the latter being white and quite fragrant.

R. Javanicum is of a somewhat different type to the preceding, and has dark green foliage that is almost smooth, while its flowers are bright orange, and produced in large clusters. This species is, however, somewhat straggling in growth and rather slow, but the color is such as to recommend it.

There are also several different forms of R. Javanicum, some of which are much better in habit and in color than the others.

R. Prince of Wales is a fine hybrid variety, of which R. javanicum is one of the parents, and from which R. Prince of Wales has doubtless secured its rich orange color. The latter has the larger flowers of the two, though, and is certainly an improvement.

Several other members of the royal household of Great Britain have been complimented in the naming of hybrid rhododendrons, among these being R. Princess Royal, a handsome free flowering sort, with deep rose-colored flowers; R. Princess Helena, which bears long, tubular light pink blossoms that are sometimes streaked with darker coloring, and R. Princess Alice, the latter having large white flowers that are flushed with pink, and also very fragrant. All of this royal group, so to speak, are remarkably pretty varieties, and well worth more extended cultivation.

Of the highly colored species, R. Lobbii is probably the most striking, the flowers of this being bright crimson in color and borne in good-sized trusses.

Probably one of the most peculiar members of this family is R. Dalhousiæ, from the fact that in its native country it is found as an epiphyte, growing on the trunk of a tree, the latter usually being an oak. R. Dalhousiæ bears quite large, fragrant flowers of bluish white tint, and the plant is inclined to be straggling in habit.

In conclusion, it may be stated that the rhododendrons in general are not specially rapid growers, and it is therefore well not to expect too much of them in that respect, but the fact remains that they are a remarkably handsome family of shrubs, and deserve a much wider distribution than has thus far been accorded them.

W. H. TAPLIN.

Holmesburg, Pa.

Canna Madame Crozy.

Were we asked to award a prize to the best new plant which has been offered to the florist trade in recent months, this triumph of M. Crozy would doubtless win the cup. Its decided advance over varieties of its own class both in size of flower spike and individual blooms is one of the most marked ever made in any class of plants. The lustrous vermillion color of petals bordered with brown yellow makes up the finest canna flower yet seen. In our illustration the flower is seen at less than two-thirds natural size. The Star of '91 probably comes nearest to it in size of spike and individual flowers, but the heads are not quite as large, the flowers more ragged and the color a duller red, unevenly distributed on the petals. Madame Crozy grows about fifteen inches taller than the Star of '91 under the same conditions. Canna Thos. S. Ware very closely resembles Star of '91.

Boston

There are indications of an improvement in the cut-flower trade. A long spell of rainy weather worked disaster among the white asters and other out-door flowers, causing a scarcity so that the demand is heard from all quarters for white asters, carnations, etc.

Roses, too, if they are good for anything, are eagerly snatched up, but there are very few decent ones to be had. It is amusing to note the altered bearing of store men, who are wont to pose in dignified unconcern behind their counters, graciously permitting the growers to come and solicit their favors, but who just now find it necessary to get out on the street by six o'clock in the morning and indulge in a neck and neck race with the street fakirs in order to catch the box men and their precious load.

At present there is a large amount of funeral design work being done. Hydrangea paniculata helps out for ground work and there are a few white Japan lilies coming in which are also useful. Lily of the valley is abundant and of good quality. Gladioluses have been very plenty and remarkably good, but are now about finished. Smilax, asparagus and adiantums are to be had in any quantity. The native pink pond lilies are all through for this season, but there are still some of the exotic varieties offered.

Chrysanthemums in this vicinity are looking well and indications point to a grand exhibition for the first week in November. In addition to the liberal premiums of the Mass. Horticultural Society there are also offered by the Gardeners' and Florists' Club of Boston two prizes of $75 and $50 for ten vases of chrysanthemums of ten named varieties, ten long stemmed blooms of one variety in each vase. These prizes, likewise all the prizes offered by the Horticultural Society, are open to general competition.

Geo. Stevenson, who has been foreman for C. J. Power at South Framingham, has left that place to take charge of the greenhouses of the late W. S. McGregor, at Winchester, which it is reported he has leased.

The old Greenlaw estate at South Braintree, which has been run by Thos. Waterworth for some time, has been sold and the greenhouse will be demolished. After a few more establishments are abandoned and pulled down there will be a living chance for those who remain.

ED. HATCH'S ANNUAL EPISODE.

Ed. Hatch has a cottage down at Cedar Point, Scituate, which he calls "The Haven" and to which he is in the custom of inviting a dozen or so of his florist friends on "Labor Day" each year to enjoy the sea breezes and partake of the luscious clams, lobsters and other good things which the neighborhood affords. There is only one drawback to perfect happiness and that is that the cottage is not large enough to accommodate over fifteen and Ned's friends number a good many times fifteen, especially when invitations are in order. He is now considering the advisability of acting upon the suggestion once made to him by brother Smith, of Washington, that is, to take out the end of the cottage towards the water and move it out to sea, where he would find abundance of space to keep on extending until there was room for everybody.

When Labor Day dawned however it brought dismay to the hearts of those who had been fortunate enough to receive invitations to this year's entertainment, for the rain came down in torrents, but for those who appreciated the compliment of having been included in the select few the storm had no terrors, and of these there were nine. The result showed their good judgment, for by unanimous vote it was declared the best time they had ever had. The stay-aways who were frightened by a little water have had to take an unmerciful guying ever since. Among their number was no less a personage than the worthy president of the S. A. F., whose antipathy to water on this occasion is unaccountable.

W. J. S.

Philadelphia.

Quite a number of florists from other cities have been in town the past week, looking up plants for the coming season. The florists of this city have the largest collection of well-grown foliage plants in this country, and in the fall of the year it is a general Mecca for the principal dealers in this stock. Messrs. Theo. Roehrs, Charles Dards and Mr. Burns, of New York, and Mr. Albert Small, of Washington, and others were among the visitors.

Mr. A. Hall, of Tenth and Locust streets, who has been very sick with typhoid fever and confined to the house for the past two months, is about again, and has opened his store, which was closed during his illness.

The greenhouse establishment lately conducted by the Furgesson Bros., and at one time one of the best in Philadelphia, was recently sold by the sheriff to satisfy the mortgages on it. It will no doubt soon be converted into building lots.

Mr. Robert Craig is absent in Chicago,

CANNA MADAME CROZY.

where he went to attend a meeting of the advisory committee of the S. A. F. appointed at Toronto to assist Mr. Thorpe.

Quite a lot of building is still going on. H. A. Dreer has erected a large range of houses to accommodate his ever increasing stock of palms and ferns. They are very substantial buildings, and should last a long time.

J. W. Colflesh, who makes a specialty of Jacques for early spring cutting, has closed in another bed. He also makes a success of carnations, and his benches of this flower when in full bloom are a sight.

A. M. Lawson, Wissahickon Heights, has erected two houses about 80x20. This is a new place and seems very favorably located.

Jacob Becker found in looking over his stock of chrysanthemums that he could not house them as well as he would like to and do justice to his other stock, so another house 160x18 is nearly under roof. There are few more careful growers than Mr. Becker, whose stock is always salable from the fact that he gives his stock plenty of room.

John Burton has also added a house for Asparagus plumosa. He is very successful with this plant, and finds a ready sale for all he can cut.

In a recent description of a New York wedding, in one of the newspapers, mention is made of yellow "Galliard" roses as being very beautiful and used in quantity. Wonder what rose this is? Perhaps some of our New York brethren can enlighten us.

Edwin Lonsdale is very partial to summer annuals, and has quite a collection, among them being some fine dwarf zinnias of all shades of color, from pure white to dark red. He has also a fine collection of cannas, which are now in a wealth of bloom.

In the ten-pin match September 10, the team of stay-at-homes defeated the team that went to Toronto by 26 pins. Capt. Longinette, of the stay-at-homes, is justly proud of his team's high rolling and it goes to prove that there are more than six good men in the club who know how to roll ten-pins.

Isaac Kennedy, a popular member of the club, won a beautiful gold medal worth $35 for putting the shot at the games of the "Bank Clerks' Athletic Association," held on Saturday in this city. Isaac's put was 37 feet 6 inches.

Trade seems to be increasing quite rapidly, and really good roses have been scarce the past week. Cosmos has made its appearance, and it will not be long before the "mums" will make their presence felt.

X.

Toronto.

We are still alive here in Toronto and have as far as I know all recovered from the effects of the work incidental to the great convention. I trust all who visited this city also feel benefitted in health by the pure Canadian air they breathed, and also by the tea, coffee and "porridge" they as freely partook of, and have resumed business at their respective habitats with renewed vigor.

It has been remarked that three out of the "quartette of Torontonians" figured in the FLORIST of August 27 are baldheaded. Of course everybody knows that bald-headedness is caused by deep thinking and early piety, and Ald. Gibbs told the members what a pious city this was, but still some of the "boys" don't wish it to go down to posterity that three out of every four Toronto florists are minus their top hair. Mr. Ewing says he has kept his hair on because he never before attended a convention.

But to put aside frivolities, here are a few thoughts which have been working in my mind since the convention, and which if the editor does not dump them into the waste paper basket, might start someone else on a fresh train of thought.

There is no doubt but that the convention has given horticulture an impetus and a lift up in this city that will be felt for all time. Things have been slowly improving all along, especially in the last few years, but an affair like this gives standing and importance to the profession which it would take twenty years to obtain in the ordinary course of events. The old-fashioned idea of a gardener with a good many people was that he should be a handy sort of jack-of-all-trades who looked after the cow, drove the boss down town and back every day, kept the house furnace going in winter, took care of the greenhouse, flower and kitchen garden in his spare moments and would stand any amount of abuse if he did not have lots of flowers, plants and vegetables on all occasions. Florists also were thought of as "only gardeners" and very "low down" sort of folks. Now I think the "cow gardener" may be said to be a kind of an extinct bird, like the dodo—at least in Toronto. Occasionally one reads an advertisement from the country, "wanted—a gardener to look after cow and horses and do chores," but they are getting scarcer every year. The florist's position now depends upon himself to a very large extent. There is no reason on earth why a wholesale or retail florist should not be every whit as good as a wholesale or retail dry goods (or any other goods) merchant. The nature of his calling ought to make him better.

It remains for the Gardeners' and Florists' Clubs, now that the S. A. F. has given impetus to the profession, to keep the ball rolling and if individual members will pocket all their petty jealousies, hard feelings and such like and only keep in view everything that tends to elevate horticulture in the eyes of the general public, depend upon it they and their descendants will reap the benefit of any self denial they may impose upon themselves

now in order to do so. United action by big and little, young and old is what is wanted in these days, and florists' clubs all over the country should elect men as officers who have not only their own popularity in view, but who at the same time can see that by elevating things horticultural and floricultural they are putting money and position into the hands of their fellows as well as their own.

I am afraid the meeting of delegates from gardeners' and florists' clubs was hardly as much of a success as it deserved to be. This was no doubt to a great extent due to the short notice given, so that important subjects which might have been discussed to great advantage had not been sufficiently thought out beforehand. It seems to me that this meeting if continued annually might do a lot of good if clubs would refer knotty or disputed subjects to it in the form of questions or resolutions which should be printed and distributed beforehand and though of course the decisions of the meeting could not be enforced they would certainly carry great weight from the fact of their having been arrived at by the combined best talent from all over the country.

It is to be regretted that there should have been ground for complaint concerning the trade exhibit. The customs department seems to have been the chief cause, the closing during and immediately after sessions coming next. The first of these causes was under the circumstances unfortunately unavoidable. Most of the custom house people I ever came in contact with (and I have travelled a good deal) seemed to have been made for the same purpose as the common house-fly—to annoy. But this inconvenience will probably not occur again for some years. The second cause can be best remedied I should think as is suggested in the FLORIST of the 3rd inst., by holding the exhibit in a separate building if close to the convention hall and in connection with a flower show. But with all due respect to the exhibitors and also taking into account the trouble and expense they are put to in bringing their exhibits to the place of convention, I think it should not be forgotten that the proceedings of the convention are the first and foremost consideration. It will be said perhaps that the trade exhibit is one of the most important parts of the convention. So it may be, but remember *it is only a part*, and if the convention should at any time fail to attract members the exhibitors would fail to take many orders. A man can manage to get along without an arm or a leg, but the arm or leg cannot do as much without the man. These are matters which should I think be thrashed out *now* so that the executive committee of the S. A. F. may be able to separate the wheat from the chaff and thus give the members the benefit of any really good suggestions that may come out.

The chrysanthemum show is the next great event I suppose with all the clubs. This club will take the matter up again at its next meeting I presume. Owing to the convention the show has been laid on the shelf for some time.

The weather is beginning to feel considerably like the fall here now and coleus are showing the effects of cold nights and cloudy days. The first frost generally puts in an appearance on or about the 20th of this month. E.

PLEASE mention the AMERICAN FLORIST every time you write to an advertiser in these columns.

Exhibition Details.

If not already attended to no time should now be lost in arranging and putting into execution your plans for advertising the November shows.

Don't wait until the last moment, and then have to hustle things so that details are necessarily imperfectly digested.

If the final, full and complete premium list has not already been issued it should be gotten out without delay, and entry blanks should be enclosed with each one; and don't forget to print right on the entry blank the name and address of the party with whom entries must be made. And it would be an excellent idea to print the rules and regulations on the back of this blank.

If the club or society is to furnish vases and bottles for cut flower displays, make sure that a sufficient supply will be on hand at the proper time. A little thought on these things now will save a good deal of hustling at the last moment.

While getting up your printed matter don't fail to provide for display cards of uniform size and style to place on the winning entries after the awards have been made, leaving proper blanks, of course, for filling in to suit the case.

If you expect to have special features for certain days, have large placards lettered now to hang up in the exhibition hall the day before, announcing the special feature for "To-morrow." They can be gotten out now just as well as on the day needed, and if in hand will save you time and worry when your attention should be concentrated on matters that cannot be provided for in advance.

If you intend to do any advertising on bill boards or in street cars, contracts should be made now, copy for the bills or placards prepared when you can do it at leisure and get the wording just right —something you can never do when hurried and worried with a rush of other details, all demanding attention at once.

Have the matter of benches thoroughly understood and provision made now for any lack in this direction. We hope that you will agree with us that chrysanthemum plants should never be placed on benches or tables. The floor is by far the best place for them. We should be able to look down on the plants, and not be obliged to look up at them. To our mind tables should be used only for cut flowers and small plants, never for so large a plant as any chrysanthemum.

Have the tables or benches ranged along or near the walls, and leave the central floor space open for a free, graceful, and natural arrangement of the plants in

beds and groups. Have some definite plan of arrangement, but endeavor to secure the symmetry of nature and not that of the scroll-sawyer. Leave broad, roomy walks that the people may not be obliged to crowd in order to see the display. And don't leave the floor a great bed or collection of brilliant colored chrysanthemum flowers alone. Tone down the glare by interspersing specimen palms and similar decorative plants.

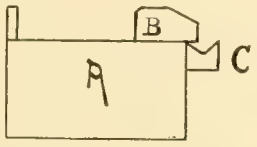
Provide a good supply of sawdust to place under and around the pots of the plants. This not only saves the floor from damage, but allows you to water the plants more freely than otherwise and the plants do not dry out so rapidly.

If you are to have displays of orchid plants, provide means for displaying them in some natural disposition, instead of on racks or any other framework of harsh outline.

If you are to have competitions for parlor decorations, attend now to the matter of providing proper divisions to form the rooms. A framework covered with silesia or similar cloth is the cheapest and best method we know of. If the hall is very high, which is apt to be the case, provision must be made for covering the tops of the "rooms," as otherwise the "parlor" effect is lost to a very considerable extent.

Another important matter that should have early attention is the painting of a large banner bearing an announcement of the exhibition, dates, etc., to be hung across the front of the building in which the show will be held. This splendid advertisement should be in position for at least a week prior to the opening of the show, and permission to so display it should be secured from the owner of the building at the time the hall is hired to make sure of the privilege. If the hall is on a well traveled thoroughfare, this is a splendid advertisement, and identifies the exhibition with the place it is to be held in a way that no other advertising can; and it is a splendid supplement to your other advertising, for the person who has seen your newspaper or poster or street-car advertisement and is not thoroughly familiar with the location of the hall has the thread of the discourse quite complete when he happens to note the banner displayed on the building. Such a banner is a good paying advertisement, and the expense is slight.

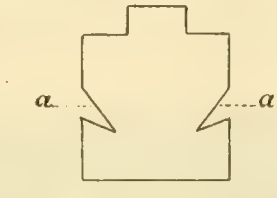
When the exhibition is open, if surroundings permit and the material is available, make some sort of a display just outside the entrance. Conifers and similar subjects are excellent. This makes a double invitation to enter by giving a taste of what is to be seen on the other side the box office.



Don't fail to provide for a liberal decoration of any bare spots in the hall. The general effect appeals to the majority rather than excellence of detail. Have the details first class, but look out for the general effect also.

Don't permit any alleged rustic houses or similar structures in the central floor space. If any are to be admitted, keep them off to one side, where they will not be obtrusive. Rustic benches in retired spots under or against heavy foliage, would serve a useful purpose in furnishing a resting place for visitors.

When getting up your printed matter, don't forget to arrange for the cards to be placed on each entry, giving number of entry and class. And have some one to see that these cards are correctly placed afterwards, so that the judges will not be subsequently embarrassed by finding the entry card for a lot of standard chrysanthemums placed on an exhibit of cut carnations, as has happened altogether too frequently for the patience of good men who have come from a distance to brave the chances of losing any friends they may have before possessed in the city in which the show is held.



Wrinkles in Construction.

This summer in constructing a house for growing new seedling carnations I have made use of a few wrinkles that may be of interest to some of the readers of the FLORIST. The house is 95x20, glass 10x12 double thick and lapped, rafters 12 inches apart with drip grooves on each.

Instead of allowing the water from these grooves to run down on the rafter plate (B) and thence down the inside of the walls of the house to rot the boards and posts, I have nailed a drip spout (C) of white pine 1x1½ inches against the gutter plate (A) close up under the rafter plate, the latter laid to project about ¼ inch inside the gutter plate. This drip spout has a V shaped groove along the upper (1 inch wide) surface and conducts the water the length of the house and out alongside of the gutter plate. Where the different pieces of the drip spout connect I make a bevel cut joint. The whole is painted before it is put up, and makes a simple and effective drainage.

In making the rafters I have had the

mill saw out a drip groove (a) (a) with a circular saw, which answers the purpose quite well. It is not so neat or smooth as the machine made ones advertised in the FLORIST, but serves as a substitute.

In putting on the ventilators I have plowed out the frame to allow the rafter muntings to set up into the ventilator frames just enough so the ventilator when down will not rest on the glass. This serves as a wind guard. If the muntings are made a trifle higher than commonly, or a strip of wood is tacked on top of the munting where the ventilators go, it will prove efficient.

C. J. PENNOCK.

"The Pines," Kennett Square, Pa.

The Public at the Flower Show.

First impressions being strongest, arrange the show so the position first taken by the spectator gives a comprehensive effect of beauty. If possible, let the entrance be roomy and decorated, using live materials. A discretionary expenditure in the lobby and about the outer entrance will not be misapplied.

A receiving committee of several of the craft who are well acquainted locally can accomplish much in making people feel welcome at their coming. Visitors like their presence to be appreciated, and a chat with those whom they all know and that are interested and posted, is pleasant to them.

Music seems to be an indispensable adjunct. That of a string band or orchestra is more in harmony with the occasion than from a brass band, as in volume of sound it ought not to interfere with conversation. Placing the musicians amid a group of palms in the center of the exhibition is a good plan, as a smaller number of performers can answer the purpose than if stationed in the gallery or other extreme parts of the hall.

Let the aisles be of ample width. At certain hours a crowd is sure to be present, and it must be accommodated. Tables of such width that only one line or class of exhibits occupy their length along an aisle are best, as avoiding undue crowding at points of special attraction.

A programme of the show for the use of the public is desirable. Leaving off the exhibitors' rules and regulations, a list of the classes and offered prizes can be a simply gotten up and inexpensive affair. It should be printed neatly on good paper. While the plan of securing income from advertisements published with the programme seems a good business stroke, it has an objectionable look of the claptrap order, and most frequently, through being gotten up in poor style, is not very becoming to the dignity that should belong to a first-class flower show. Besides the details interesting to the visitor, have the programme briefly but distinctly include the arrangements of the displaying of different features on different days; also let such be properly placarded in the hall, as has been suggested in these columns.

The policy of selling flowers at the show seems questioned. Some argue that it looks like imposing on the public and that we should rest content with the admission fee only for revenue. That it lacks dignity; is a breeder of jealousy from those liable to be interested in its conduct, and induce unscrupulous visitors to presume that flowers carried in the hands of purchasers having been given to them, entitles them in turn to free flowers. I believe, however, that a privilege of selling flowers let to the highest responsible bidder, under stated restrictions, and requiring the erecting of a flower booth decorative in feature would properly work to a benefit, and enable true flower lovers to agreeably indulge their fancy when at the show.

The giving away of flowers in any general way by exhibitors is a breeder of mischief sure to be demoralizing to a due respect of the ownership of the exhibits before the close of the show. Exhibitors should bring nothing into the show except for display; the last paying visitor is entitled to see it all, and the hall committee should have absolute control and be invincible against any unwarranted removal of any exhibit.

The florists having the inside track on cost of decorating materials, the exhibition space should be made cheerful and appropriate. Foliage, even if of common character, filling in nooks, corners, or bare spaces, garlanding here and there, etc., costs little, and counts much in general effect.

As a rule, my opinion is that the necessary efforts given to conducting a flower show pure and proper on its merits will accomplish as much or more than assimilating with it the interests of charitable institutions, side shows, serving refreshments, etc., worthy as are good causes of that class.

The Advertising Department of the AMERICAN FLORIST is for Florists, Seedsmen, and dealers in wares pertaining to those lines ONLY. Please to remember it.

Orders for less than one-half inch space not accepted.

Advertisements must reach us by Monday to secure insertion in the issue for the following Thursday.

Address THE AMERICAN FLORIST CO., Chicago.

WE ARE pleased to announce that we have secured the services of Mr. Wm. J. Stewart, of Boston, as General Eastern Manager of the AMERICAN FLORIST. Mr. Stewart is so well known to our readers that no introduction will be needed, and that he can by devoting his full time to the interests of this journal add very materially to its value to our readers none will doubt. He has had twenty years' experience in the cut flower trade, part retail and part wholesale, is a graceful writer, thoroughly understands what is of interest and practical value to the trade, has visited all the leading establishments in the country and none has a larger acquaintance among those in the trade. His thousands of friends will we are sure be glad to learn that he will as the Eastern Representative of the FLORIST be enabled to visit them much more frequently than in the past It will be unnecessary for us to bespeak for him a cordial welcome as the representative of this journal, for this he would have in any event. For the present his address will be as before, 67 Bromfield street, Boston, Mass.

TO THOSE at all familiar with the time usually needed for photographing, and engraving by the half-tone process, the plate on another page from a photograph of an event that occurred last Saturday evening will cause some wonder as to how the feat was accomplished, and that there was some mighty quick work done all will agree. The photo was taken by flash-light, and was, of course, not nearly as distinct as if taken by daylight, but the plate gives a fair general view, though at considerable sacrifice of detail.

MR. AREND BRANDT, Newport, R. I., sends us some magnificent hydrangea blooms, both of the hardy one, paniculata grandiflora, and the blue colored one so largely grown at Newport. And the ones sent are colored the deepest blue of any we have seen. A bed of plants covered with the great, massive heads of deep blue flowers is a sight worth going miles to see.

JAMES B. NEAL is said to have opened a flower store in San Francisco. Some parties in Washington and Chicago may still remember Mr. N. and be pleased with the reflection that in case he makes later another westward jump he may meet the fate of the lamented McGinty.

MR. W. A. MANDA, of Short Hills, N. J., has been appointed by President Norton to fill the vacancy on the executive committee of the S. A. F. caused by the election of Mr. James Dean to the presidency.

ALWAYS mention the AMERICAN FLORIST when writing to advertisers.

News Notes.

RIVERSIDE, CAL.—Mr. E. L. Koethen, formerly of Zanesville, O., has located here and will cultivate certain floral specialties.

RICHMOND HILL, N. Y.—Mr. Alex Lindstrom is completing a new house 100x11 for Primula sinensis. This gives him a total of 10,000 square feet of glass.

LOUISVILLE, KY.—F. W. Wrampelmeier has added and just completed 3 more rose houses, making a total of 5,500 feet under glass, heated by hot water. His specialties will be roses, carnations and cut flowers in general.

MEMPHIS, TENN.—Mr. J. T. Williamson has just added two new rose houses 100 x20 to his already extensive plant, thus making it one of the best equipped places in the South. Much satisfaction is felt here at the appointment of Mr. John Thorpe as chief of floriculture for the World's Fair.

STONEHAM, MASS.—Three ladies while strolling in the woods in this town were poisoned by eating of the roots and stems of the Water Hemlock (Cicuta maculata) which is a deadly poison, but which they mistook for something else. Two of the ladies died within a few hours and the third had a very close call.

CINCINNATI.—Mr. H. L. Sunderbruch has opened a wholesale commission cut flower store at Fourth and Walnut streets. "Harry," as he is known to a wide circle of acquaintances, is very popular with the florists of the west and should have no difficulty in establishing a good business, as this city has now become quite a producing center.

DIRECTORY.
Every Florist, Nurseryman and Seedsman should have one.
AMERICAN FLORIST CO., Chicago.

The Seed Trade.

AM. SEED TRADE ASSOCIATION.

F. BARTELDES, Lawrence, Kan., president; A. L. DON, New York, secretary and treasurer. The tenth annual meeting at Hartford, Conn., second Tuesday in June, 1892. Applications for membership should be addressed to Wm. Meggatt, chairman membership committee, Wethersfield, Conn.

Duty on Catalogues.

ED. AM. FLORIST:—You will notice by the enclosed that you should not complain because the Canadian authorities charge duty on American seedsmen's catalogues, as this same thing is still practiced in this country. A. BLANC.

Philadelphia.

[The enclosure was a wrapper used on H. Cannel & Sons' catalogue (English) and the book had been rated as worth 50 cents and a duty of 13 cents charged and collected. Another cry for free trade.—ED.]

A GOOD AUTHORITY speaks as follows regarding the new tomatoes: Henderson's 400 tomato has been very fine in spite of the wet weather. Its faults are, too great size and a good many rough specimens. It has not ripened well to the stem, but may do better in a dry season. It is earliest of the very large sorts. Ring Leader is very similar. Brandywine, Table Queen and Atlantic prize are all good. Early Ruby is early but too small.

ONION SETS.—These are larger on an average this season than last, and prices at present are about as follows: Yellow and red, $2.00 to $2.25 per bushel; whites, $2.50 to $2.75 per bushel. There is some stock of the latter which show signs of decay.

SOLD OUT.—E. W. Allen & Co., Portland, Oregon; F. J. Motts & Co, Huron, Dakota.

TOMATO SEED is reported as about 65 to 75 per cent of a crop in Ohio.

Bridgeport, Conn.

James Horan, the florist, is busy remodeling a block of seven of his old houses and reducing the number to five, covering the same space as originally occupied by the seven. The posts, rafters, purlins and gutters are all of iron; there is no wood used except the ridge, sash-bars and siding. Hitchings & Co. have the contract for the iron work. When finished they will be large, airy, strong, but light structures. The potting and packing sheds, which run across the end of this range, have been remodeled and rebuilt, making a large, roomy building 120x16. Mr. Horan's specialties are roses, carnations, and chrysanthemums. The roses have made splendid growth and promise well for winter. A house 20x120 of chrysanthemums planted on the benches and grown to two or three stems look exceptionally fine, and later will undoubtedly show some fine flowers. Thousands of chrysanthemum plants are grown in pots, tubs and benches, besides the house above referred to.

Carnations are largely grown, eight houses being occupied by them, and they look very fine. Many of the novelties in this line are on trial. Fred Creighton is a favorite, and Mr. H. says that each succeeding year it does better with him. Lizzie McGowan is the poorest grower so far in the entire collection. We seldom see a house of camellias nowadays, but here they can be seen with heads as large as maple trees. The varieties are mostly alba plena and fimbriata.

There is also in this house two famous specimens of Acacia pubescens planted out and some fine specimens of A. Drummondi in pots. Both varieties are valuable for cutting for decorative purposes.

A large collection of bedding plants are also grown for retailing, and a large house is devoted to palms and other decorative plants. Mr. Horan's fine residence is surrounded by a lawn containing flower beds, and belted on the outer margin with choice shrubs, weeping trees and herbaceous plants, and when the new iron houses are finished it will be the most complete florist's establishment in this part of the country.

JOHN DALLAS.

SITUATIONS, WANTS, FOR SALE.

Advertisements under this head will be inserted at the rate of 10 cents a line (seven words) each insertion. Cash must accompany order. Plant advs. not admitted under this head.

SITUATION WANTED—By a gardener and florist; 9 years' experience. Private place preferred. A J, Box 55, Lake Geneva, Wis.

Three greenhouses, with dwelling, in good condition, situated just outside of Milwaukee, suitable for growing for either wholesale or retail trade. For particulars, address WISCONSIN FLOWER EXCHANGE, 131 Mason Street, MILWAUKEE, WIS.

FOR SALE CHEAP.

A 15-horse power steel Locomotive Boiler, including stack. Guaranteed in first-class order. 90 lbs. pressure.

LA ROCHE & STAHL,
1237 Chestnut Street, Philadelphia, Pa.

TO LET ON LEASE.

For a term of years, one of the **Largest** and most **Complete** Greenhouse establishments in the **West.** For particulars, apply to

HORTICOLE,
Grand Central Hotel, New York City.

A Splendid Business Opportunity.

I will sell my half interest in our seed business, because I have made money enough and wish to retire from a busy life. I established the business in 1868 and have made money ever since. Our town of 90,000 inhabitants is growing rapidly and we have the largest seed trade in town. I can leave a partner who has had 7 years' experience, is young and honest. This is a fine opening for a man with a few thousand dollars who wants to live in York State.

Address SEEDSMAN, care American Florist.

FOR SALE.

Nine greenhouses, 10,125 feet glass with 2 acres of land and stock for sale very cheap, and on easy terms; the reason is retirement from business and inability to devote the time to it.

The houses are new and in splendid condition, situated in one of New England's best localities, with a large and extra good home market and established trade. Three houses 60x18 feet, four houses 60x10 feet, one house 60x22 feet, one house 75x14; 8,000 plants of general stock; 2,000 roses planted this summer and ready for bloom now; 5,000 carnations of the leading varieties; 3,000 violets; 1,000 chrysanthemums; a bed of young strong smilax—700 strings; stock of palms and decoration plants, representing a wholesale value of $800; hardy shrubs, vines, etc., wholesale price $150. A complete supply of winter forcing and bedding bulbs, and 10,000 lily of the valley just imported, representing a wholesale value of over $400; 50 sash 4x6 feet for cold frames; also 20,000 pots, all sizes. The houses are all complete with steam heating apparatus, a new twin boiler of the "Florida" pattern with 3,000 feet of pipe. There is a large splendid potting shed with office building, and all necessary tools and implements.

The price on property, land, houses with stock, heating apparatus, tools, implements, etc., etc., is $6,500, part of which can stay in the property as first mortgage. For further particulars, write to

Classification of Chrysanthemums.

The classification of chrysanthemums having been placed in my hands by the National Chrysanthemum Society, I have associated with me Mr. A. H. Fewkes and we would respectfully request the co-operation of, and solicit correspondence with, all chrysanthemum growers and anyone interested in the subject.

It is the intention of the committee to have all the information embodied in the report as authentic as possible. Any communications addressed to Mr. A. H. Fewkes, Newton Highlands, Mass., or myself will be thankfully received and promptly attended to.

1000 SMILAX FROM 2½-in. POTS,
twice cut back, $1.50 per 100, $12 per 1000
Address **DANIEL LEE, Madison, Ohio.**

Calanthes as Florists' Flowers.

Of late years considerable attention has been turned towards growing that class of orchids that will cheer up with their bright flowers the dull months of winter, and especially about Christmas and New Years, when flowers are scarce and this luxurious demand at its height. To meet this demand I feel justified in saying that there is not any class of plants, even among orchids, that can compare with some varieties of the calanthe.

Take C. Veitchii, with a flower spike 3 to 4 feet long, gracefully arched and bearing as many as 45 blooms of the most beautiful rose color, and you have something void of stiffness and something that will please the eye of the most refined. There are varieties of vestita no less valuable for room decoration, but they differ from the former in color, the flowers being of a delicate creamy white, with in some forms a colored spot on the base of the lip, which adds greatly to their decorative value. With such plants at our command the scarcity of flowers at the times already referred to may be easily overcome. Given judicious treatment the calanthe will grow with great rapidity and soon the foliage will assume the appearance of Phaius grandifolius, and it is when grown to present such an appearance that one is afterward rewarded with their great assistance in the time of need.

In the greenhouses of Mrs. Lasell, Whitinsville, Mass., may now be seen hundreds of this nob'e orchid in just the condition I have already stated, and her gardener, Geo. McWilliam, finds no difficulty attached to their culture more than in growing fuchsias or such like soft wooded stuff. Some of the bulbs already measure 14 inches in length and have not finished their growth, while some of the leaves by actual measurement are 25½ inches long and 8 inches wide. If we may judge their future by their present appearance, they will when in flower produce a sight rarely to be seen.

With some calanthe growing has been abandoned merely because they failed to give the expected results and the blame was attached to the want of a proper place to grow them in. Success will seldom crown the efforts of such a grower. To succeed one must be persistent and watch very carefully the requirements of what he undertakes to grow and although it may take time he will doubtless overcome the difficulty. Anyone having a glass structure and the power to maintain a temperature of about 70° can successfully grow calanthes after having gained a knowledge of their requirements.

GOOD NOVELTIES
WORTH CATALOGING.

AGERATUM WHITE CARPET (Tapis blanc), a decided improvement on old sorts, of purest white, and freest blooming habit. 12 for $1; $4 per 100.

ABUTILON WHITE NECK, a pleasing rose color with a white base toward the calyx, large well shaped flowers. 12 for $1.00; $6.00 per 100.

COLEUS SUPERBE, the best and brightest out of 500 seedlings, a decided improvement on all existing sorts, leaves large, grand, color flame red with darker reflex, light golden border. $2 per 12.

SALVIA KOBOLD, The late blooming of S. splendens was always a drawback; here we have an early bloomer, dwarfer and more compact growth and flowers greater substance, nearly twice the size of splendens. $1 per 12; $6 per 100.

SAPONARIA JAPONICA, Double flowering, a hardy perennial which deserves universal cultivation, will grow and bloom all summer in any soil and under most adverse conditions even; for cemetery we know of nothing better; blooms in clusters, perfectly double white, turning pink as flowers fade. $1 per doz.; $6 per 100.

Electrotypes can be had of above later.

We have thousands of Bouvardias, at $4.00 and $6.00 per 100, in all colors.
Primula sinensis, single white, and Kermesina, $4 00 per hundred.

JOHN RECK, Bridgeport, Conn.

"A Source of Errors in Nomenclature."

Let me add my little say in endorsement of what Mr. A. R. Congdon says on this very important subject on page 96, September 3 issue.

It is a good many years ago since the writer had some cuttings of the dark coleus Hero given to him. That coleus went under the name of Nero for a long time, until a better informed brother gardener straightened the matter out.

Chrysanthemum Elain went under the name of Le Nain for a number of years in that quiet little town where we first became acquainted with that good old variety.

The name of the French dwarf or Crozy cannas are the source of great perplexity to me: No comfort in "half the name suggesting the rest," in the French language, to the average gardener and florist.

I wish the Frenchmen could be made to see the importance and the necessity of printing their labels, for the benefit of us poor benighted Americans. Then let the florists here follow suit.

True, most of the progressive men in the trade do print their labels, but as a rule the names of the novelties are rarely or never honored by this much needed reform. Hence when we come to copy the names from backhanded, angular hieroglyphics which we are generally tortured with, it is no wonder that they are hardly recognizable, often meaningless and consequently ludicrous.

If the number of novelties disposed of the first year do not warrant the printing of the labels by machinery, the prices charged for and consequent profits made on novelties certainly should command the services of at least one good pencil pusher at every establishment where this branch of the business is one of the specialties. YORK.

When writing to advertisers please mention the fact that you were induced to write by the advertisement in the American Florist. You will benefit us by letting advertisers know that it is the Florist that is bringing them trade.

When sending us small amounts in postage stamps, please select those of the 2-cent denomination.

AHEAD OF EVERYTHING.
We Follow None, Prize or No Prize.

Our latest improvements in machinery produce a Standard Pot which for lightness, smoothness and durability, has never been equaled. Customers buying of us will

SAVE ONE-THIRD IN FREIGHT.

And to prove this, we give below a table showing number in Crate and WEIGHT of same, which speaks for itself:

Size.	No. in Crate.	Weight.
1½-inch	3,000	250 lbs.
2 "	2,400	250 "
2½ "	1,750	250 "
2¾ "	1,450	250 "
3 "	1,280	350 "
3½ "	800	350 "
4 "	600	350 "

It will be seen at a glance, that our pots are one-third lighter than formerly, and yet we claim that owing to the superior quality of our clay and improved machinery, they are stronger than any pot in the market, and we frankly ask you to make the test. ☞ SEND FOR PRICES.

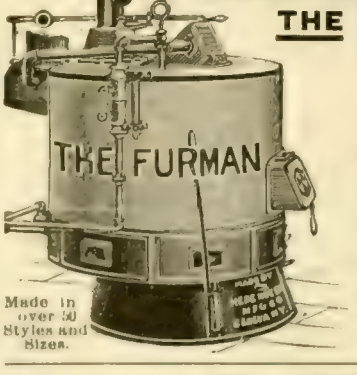
LANCASTER, PA.—There is quite a bit of building going on here; Messrs. John Bitner & Co. have added a large rose house to their extensive plant, formerly run by Messrs. Conroy Bros.; Mr. Edward Conroy has purchased a place in the southern part of the city and has erected a number of houses thereon; Mr. Willis Rohrer has added three large rose houses, making his plant the largest in the city; Mr. Henry Rohrer is also adding several houses; Mr. Schroyer and Mr. Geo. Wilson have each added a house and Mr. A. M. Herr has built two houses each 140 by 20 to accommodate his stock of Lizzie McGowan carnations; he will devote his entire plant to the growing of carnations this season; he has also built two large houses for propagating carnations. Mr. D. K. Herr will add several houses this fall, making a fair showing for a town of less than 50,000 inhabitants.



MR. A. INGRAM, who has creditably represented in this country the establishment of F. Sander & Co. in the past, has made a change and now comes as the representative of Hugh Low & Sons, Clapton Nursery, London. Mr. Ingram's friends are always glad to see him no matter whose card he presents.

WE ARE advised that no less than thirty carnation growers have already expressed themselves as in favor of the formation of an American Carnation Society. We hope that every grower of carnations in America will be heard from either one way or another.

Cut Flower Growing.

One of the most profitable florists' establishments in or near Chicago is that of Messrs. E. Weinhoeber & Co. They have a well appointed store on the north side in the residence district and sufficient room for several moderate sized greenhouses there, and at Park Ridge they have one of the largest and best appointed cut flower growing establishments around Chicago. All the flowers they grow are retailed in their own store. The store trade is looked after by Mr. Weinhoeber, and the Park Ridge establishment is conducted by his partner, Mr. E. Buettner. At the city greenhouses are kept the splendid lot of decorative plants for use in house decorating, also a house of ferns for cutting, and flowering plants grown at Park Ridge are here held in condition until sold. Some bulbs are also forced here and the flowers cut as called for.

But at Park Ridge the great quantities of cut flowers they use are grown, and to Park Ridge we paid a visit last Saturday. Mr. Buettner has not yet returned from his trip to Europe, but his right hand man, Mr. W. G. Earle, did the honors of the place, and to him we are indebted for the following information regarding varieties grown and methods pursued at this place:

Two houses, each 16x125, are filled with chrysanthemums planted out on benches for cut flowers. The main white sorts grown for cut flowers in this way are Elaine for earliest, followed by Jessica, White Elephant, L. Canning and a very late white of which they do not know the name, the labels having been lost in some way. In whites they have discarded Moonlight, Mrs. Langtry, Christmas Eve and Puritan, the shortcomings of these varieties having been either too small a flower or dropping the petals too quickly to meet the requirements of a good cut flower. And one objection to Mrs. Langtry at this place has been that while it bloomed freely it was a tall, straggly grower. And from none of those discarded could they cut the amount of flowers of good quality that they could from the sorts retained and which form the bulk of their present stock. Puritan and Canning come in together, but they find that they can sell at their store ten bunches of Canning to one of Puritan.

In yellows Christine Golden is their earliest sort and they grow a large quantity of this variety. Next come J. C. Heuszey (not positive as to the correctness of this name) and Pres. Hyde at about the same time, then Mabel Douglass, H. E. Widener, Mrs. Winthrop Sargent and Grandiflorum. In yellows they have discarded as undesirable cut flower sorts: Glorioswm, Peter the Great, Mrs. J. N. May and Yellow Prince.

Of pinks the bulk of the stock is composed of M. E. Nichols (October Beauty) for earliest, succeeded by John Lane, Christine Pink and Pres. Arthur. Lilian B. Bird and Mrs. Mary Weightman are on trial as cut flowers and are considered very promising.

The other colored sorts grown are mainly Cullingfordii, Paul Bert and Val d'Andorre.

These are all grown planted out on benches in soil about the same depth as for roses. The plants have never been from under glass, being propagated in usual course and planted out on the benches about June 1 last. They are placed very close together and now present a solid mass of foliage, the plants varying from 18 inches to 3 feet high according to variety and the earlier sorts all showing strong flower buds. A difference in growth of the plants in two adjacent beds was explained by the statement that the soil in the one showing the stronger growth was all strong new soil, while that in the other bed was a mixture of old and new soil, showing beyond question that it pays to give the chrysanthemum the best, and that while not as delicate as some other plants it shows appreciation of good care and nourishment. All the bedded plants were carefully staked with hard wood stakes held in position by being tied at the top to wires stretched lengthwise of the house.

In one of the houses were noted several hundred handsome little pot plants of chrysanthemums, averaging about 14 inches in height and very symmetrical in form, nearly all showing flower buds. These plants were propagated from trimmings from the bedded plants and were put in the sand bed about July 1 last. When rooted the cuttings were placed three in a 3-inch pot, and as they grew on were shifted into 4-inch pots, in which they will bloom. These plants produce even larger flowers than the larger plants and when in flower meet with a very ready sale to people who want a moderate sized blooming plant to decorate the window of their dwelling.

As Messrs. Weinhoeber & Co.'s stock is selected for the purpose of supplying flowers for their own retail sales only, the proportion of the various kinds and colors of flowers grown indicates pretty well the demand in this city, and therefore we give the quantity as well as the kinds of carnations grown. Grace Wilder is their best and most profitable pink sort and they grow a house 16x125 full of this variety. Of red varieties they have a house 10x125 of which two-thirds of the plants are Portia and the remainder Garfield. The latter sort they do not like very well as it is too late a cropper, and will next season discard it altogether. In another house they have a bench 6x120 of Silver Spray, one 3x125 of Hinze's White and a bench 3x125 devoted to sorts on trial. These include Tidal Wave, Lamborn, Mrs. Fisher, Lizzie McGowan and Nellie Lewis.

They have 6 houses, each 16x125, de-

voted to roses, and the following will give an idea of the proportion of sorts they have found best and most profitable in meeting the demands of their retail trade: House No. 1—Beauties, Bennetts and Capucines; No. 2—Beauties, Bennetts and Bon Silenes; No. 3 —La France, Cusins, Bon Silenes; No. 4—Perles, Hostes, Cusins, Gontiers; No. 5—Mermets, Cusins, Gontiers; No. 6—Brides, Cusins, Gontiers. This will also give an idea of the sorts they have found it best to grow together in the same house, the taller growing sorts being placed in the center beds and the lower growing kinds on the side benches. Then there are two houses of hybrids and the sorts grown are Ulrich Brunner, Mrs. John Laing, Jacqueminot, Diesbach and Rothschild. Speaking of the Cusin, Mr. Earle said that with them it was a very free bloomer ordinarily, but it was very apt to throw its leaves and thus suffer a check in growth. The tea roses do not look as well as usual this year, the very hot weather we have had having burned the foliage of many of the plants.

A house of mignonette was looking well. It was of the Machet variety. Mr. Earle says that it should always be grown in a solid bed, with the glass as near the bed as possible. The mignonette wants a cool bottom and in winter he maintains a temperature just above freezing.

They are growing this year 12,000 freesias, all for sale at their own store, and they find the demand increasing every year. As this is rather at variance with the experience of other growers we enquired closely as to the cause of this demand and we found it in the fact that they make but one cut from the bulb, taking foliage, buds and all as well as the first fully opened flowers. Cut in this way they can sell all they grow and at profitable prices. They do them up in bunches of a dozen cuts.

They also have a large house of Marguerite daisies and have a good call for them, but they cut the flowers with long, leafy stems.

The violets in the field showed the effects of the very dry summer and the plants were not nearly as large as usual at this time. And a big black bug about $\frac{3}{4}$ of an inch long has eaten up nearly all their aster blooms this year.

They tried the Marguerite carnation in the open ground this year, securing the seed from the originator, but half the flowers have come single, and though the season has been unfavorable it gives so little indication of being useful that they will not bother any further with it. But a patch of the double sunflower has been producing a lot of fine salable flowers and has proved very profitable in supplying summer flowers, some of their customers mistaking them for yellow summer blooming chrysanthemums.

In the packing shed were a lot of tulip bulbs grown on the place. Though rough in appearance they were good strong bulbs, but Mr. Earle didn't think it would pay them to grow their own bulbs, unless made a specialty of and grown in very large quantities.

Their Lilium Harrisii and L. longiflorum are potted and plunged in frames out of doors and their narcissus is also boxed. Their Roman hyacinths, etc., are all forced in the greenhouses in connection with the city store and the flowers cut from the bulbs as called for.

WHEN you write an advertiser tell him that you saw his advertisement in the AMERICAN FLORIST.

Take Warning.

The excessive hot weather of the past two weeks has so excited the growth as to make the plants as tender as any coleus. Now in case the weather changes from 85° to 40° or lower in a day, the results will be disastrous to the buds. Therefore it is very important that means for temporary protection be on hand for those plants which are out of doors and cannot be housed on short notice.

All staking and tying of plants should be completed as early as possible. The thinning of buds should be proceeded with from day to day, and pray don't be afraid to thin, as on this depends the value of the crop. One good flower is worth ten poor ones.

The feeding of all plants with liquid manure can be safely done now at any time, providing the stimulant is not too strong and the plant requires watering.

Keep a strict watch on insects of all kinds. Where plants are housed, slight fumigations of tobacco three or four nights in succession will kill effectually black and green fly and white thrip, but be careful not to make the smoke too dense.

Plants out of doors should be syringed with weak tobacco water at intervals, being careful to wash the under surfaces with the decoction. JOHN THORPE.

The Chrysanthemum Bug.

On looking over my very welcome Saturday visitor, the AMERICAN FLORIST, I find on page 102 some most valuable suggestions by "P.," Brookline, Mass., concerning the chrysanthemum bug. I don't know of a chrysanthemum bug by that particular name, but suppose from the context that the black aphis is the pest in question and feel satisfied from what I see of its ravages in this section that any information tending to suppress or repel it is timely and acceptable.

I agree with P. that the egg-laying fly which first makes its appearance derives no sustenance from the plant and in itself does no particular harm outside of laying the eggs and wounding the plants, but the horrible little squirming pests that are the produce thereof are the real mischief workers and like their green brothers on the rose are a source of constant irritation.

From my experience with them I feel satisfied that they are parasites, feeding on the sap of the plant, and derive their color from the plant on which they feed and grow in size in proportion to the vigor of that plant. If any of your readers who are curious and fond of experiment will plant some of our rapid growing golden rod among their roses and chrysanthemums, they will find the aphis green on the rose, black and slightly larger on the chrysanthemum and on the rapid growing golden rod they will find them much larger than on the other two and red in color. I am satisfied they will find that they are one and all simply the same aphis and derive their sustenance, strength and color at the expense of the particular plant by boring through the bark and absorbing the sap.

There is no objection to the tobacco treatment for these insects, syringing and fumigating alike being effectual in destroying them, but these methods both have their drawbacks, as syringing is a tedious job and must be often repeated, and fumigating necessitates the growing of the plants all along in the house.

The best preventive, however, of aphis that I know of is quassia. An ordinary quarter pound bag of quassia chips immersed continually in the water-butt will drive the aphis from any plant infested by them. I use this continually on my plants at the root and occasionally on the foliage, and although the egg-laying fly makes her usual visit, her progeny will have nothing to do with the plant after they have once tasted the bitter principle of the quassia which has been absorbed by the roots and carried in the sap to the tender leaves and shoots.

Although I have never noticed any evil effects from using the quassia water in great strength, as it appears a tonic rather than otherwise, still I like to be on the safe side and use about a quarter of a pound of chips in a twenty-gallon water-butt. It is only necessary to renew the chips about every five days or week, as the same chips kept immersed in the water will supply the bitter principle to the water for that period, and the plants can be continually supplied with it at a very slight cost.

If the plants are growing in the open ground I find that a light mulch of the chips raked into the soil about the plant and renewed once or twice a month is very effectual.

I am ignorant whether or not your subscribers know of this preventive, but if they will try it they will have no further use for tobacco as a cure for aphis on the chrysanthemum.

LINDLEY M. HUGGINS.

Baltimore, Md.

SEE ELSEWHERE under the head "Cut flower growing" for other chrysanthemum notes.

Fine Asters.

Enclosed you will find the result of a visit to Mr. James Semple, of Bellevue, Penn., to see his asters. Being so surprised and delighted at the "show," thought the FLORIST should have a small bunch, at least, and hope they may reach you in fine condition. We are quite sure they deserve to be rated very high class, but want the FLORIST'S superior judgment. Mr. Semple is justly proud of the rich pink variety, and has for five years jealously guarded this strain, which now reaches such a high state of perfection, and will the coming season put the seed on sale. The pink will be known as "Mary Semple," after his charming daughter, and the white as "Semple's White." No special treatment in the way of fertilizers has been resorted to, which would indicate the possibility of even superior results. N. PATTERSON.

Pittsburg, Pa.

[Of the ten blooms sent, none were less than $3\frac{1}{2}$ inches, and some were almost full 4 inches across. When lifted from the box and seen at a short distance we thought they were certainly some very early chrysanthemums. The colors were excellent; the pink is a beautiful shade, and the white a good clear tone. They were decidedly the best asters we have seen. Since the lot arrived from Mr. Patterson another and larger lot of blooms

BASKET OF ORCHIDS.

was received from Messrs. Ludwig & Richter, of Allegheny City, evidently from the same strain of seed, though a larger range of color was shown, including red, blue and lavender, and these were almost as fine as the flowers sent by Mr. Patterson. Such flowers will be heartily welcomed by the cut flower men.—ED.]

The Largest Horticultural Society in America.

Anything that increases the love for flowers and the demand for them is of special interest to the florist, and that the Springfield (Mass.) Amateur Hort. Society has done this is a self evident fact to all those who visited their show the 1st and 2nd of this month. Horticulturists like Peter B. Mead and others who have been in the business for years pronounce it the largest and best exhibit of out-door flowers ever made in this country and with two exceptions all the exhibitors were those who follow some other business for a living. This show was also a grand success financially, as all the other shows of this society have been. No less than 48 new members were added to the list at the last meeting, making now 832 life members, the largest horticultural society in this country, and it will not be three years old until the 1st of January.

As this society is conducted differently from other horticultural societies, it may be of interest to the readers of the FLORIST to give a short synopsis of the way in which it is conducted. The principle upon which the originator of the society worked was that it was not so much a member's money that we wanted as to get him interested in the society and the cultivation of flowers, knowing full well if we accomplished this there would be no lack of money. The price of admission for gentlemen is $1 and for ladies 50 cents; for life membership there are no dues. All the money that is needed is made from the exhibitions and the society has between $900 and $1,000 in cash and $200 worth of tables.

In order to get the members interested, meetings are held twice a month, except in July, for the discussion of fruits and flowers. Essays are read at these meetings, and then a discussion follows in which all the members participate.

Once a year, at the June show, ten tickets are sent to each member, which he is expected to sell or give away, and return $1 to the secretary. The price of admission to the exhibitions is only 10 cents. Everybody goes, and but few tickets are returned unsold. At the exhibition just past no tickets were sent out, and a nice sum has been cleared after paying expenses, although not so much as from the spring show. At the exhibitions there is no judging or premiums; each exhibit is tagged with the grower's name, and the public does the judging, and at this last exhibition, with so many exhibitors, I have not heard one word of complaint from anyone. There are those who are not members of this society who predicted its downfall in six months, and who say a society conducted in this way cannot stand, but up to date it is the liveliest corpse in this country, as those who have made its acquaintance can testify.

CHARLES L. BURR, President.

Basket of Orchids.

We present herewith an engraving from a photograph kindly sent us by Mr. A. Dimmock, now in England, of a basket of orchids presented to the Empress of Germany by Mr. F. Sander, of St. Albans, England. It consisted of the rarest and most costly flowers in his collection, and was a work of artistic merit. Among the flowers employed were numerous cattleyas, such as Mendelii in variety, Sanderiana, chrysotoxa, Gaskelliana, Leopoldii, all cut with pseudo-bulbs and leaves; Oncidium crispum grandiflorum, Gardnerianum, macranthum, undulatum, Loxense; Odontoglossum crispum, Pescatorei, histrix, Wilckeanum, Harryanum, Schroderianum, vexillarium; Aerides Leonis, Sanderianum and Lawrenceanum; Cypripediums caudatum, Schroderæ, Rothschildianum, Sanderianum; Epidendrums Frederici Gulielmi, vitellinum majus, Wallisii; Dendrobium formosum giganteum; Cymbidiums, Thunias, Saccolabiums, Masdevallias, etc.

A Historical Plant.

ED. AM. FLORIST:—In Downing's *Horticulturist* for 1849, page 541, is a notice of a fine plant of Cycas revoluta in the possession of Mr. Thorburn at his establishment at Astoria, Long Island, that was greatly prized because it was once owned by President George Washington.

If this plant is still known to be in existence, we want that plant at the World's Fair. Who can give any information about it?

On reference to the visitors' guide to Mount Vernon I find the following: "At the end of the central walk is the new greenhouse built and partially supplied by an appropriation from congress. This stands on the site of the original Washington conservatory which was destroyed by fire December, 1835. On that disastrous night very few of the rare plants were saved, among them a large bearing lemon tree, a century plant and *a sago palm*. Of these now there can only be seen part of the body of the cherished old palm, though there is a hardy young growth from it."

It is more than probable from this that Thorburn's plant of 1849 was a slip from the old tree, but it is nevertheless interesting. EDGAR SANDERS.

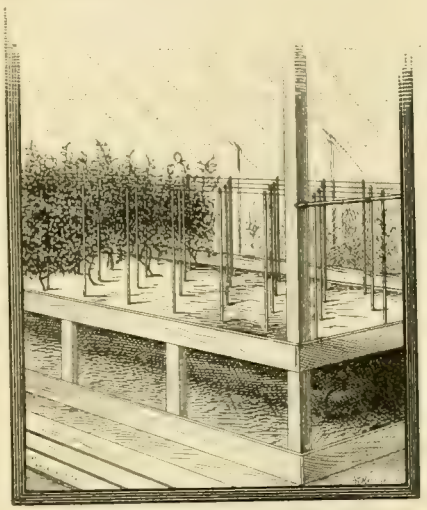
Lilium Harrisii for Christmas.

Will some successful grower of Lilium Harrisii please tell me through the FLORIST the time to plant bulbs to get a good crop of blooms for Christmas, also their treatment from planting until planting next year? READER OF FLORIST.

Staking Roses.

Much has been written about staking carnations, some growers advocating one way, some another and some not staking at all; but nothing has been said about the different methods of staking the rose. All growers evidently take it for granted that the "Queen" must not be permitted to run at large, but the question as to what system of training is most practical seems never to have been considered. Most growers at present use cane stakes, and though they are by far the neatest in appearance of anything that can be used, being light they rot off quickly at the surface of the soil and along toward spring when the sun begins to get pretty hot and heavy syringing is necessary in order to keep down the red spider, they are very apt to knock over and look badly. To avoid this and keep them always upright, even though they do rot off, I stretch a heavy wire directly over each row of plants, three and half feet above the surface of the soil, to which the top of each stake is fastened with a piece of fine wire, which holds it in position firmly, always cutting the stakes four feet long, which with four inches of soil will allow the stakes to extend two inches above the wire. This gives a house a very neat appearance and though but a little thing it will improve the appearance of a house of roses 20 per cent.

For low beds which are near the glass I use no staking at all. Instead I stretch a heavy wire directly over each row of plants, for Niphetos and Cusin ten inches and for the stronger growing kinds twelve inches, above the surface of the soil and tie the shoots to it the same as one would tie grape vines to a trellis. As the plants increase in size I draw the branches over from one row to another and thus bend them over slightly, which causes them to break farther down the stem than they would if growing upright, thus increasing the quantity of blooms very materially. I have used this system for some time and find it much more satisfactory than any system of training I have yet seen. EDWARD SALYER.



Toledo, O.

[Mr. Salyer is in error in saying that this subject has not been touched upon before, but the point is an important one and we give his communication space. And supplemental thereto we present herewith an illustration which appeared on page 470 of Vol. 3 of the FLORIST, the issue of June 1, 1888.—ED.]

Market Bouquets.

The illustration shows two kinds of bouquets that are sold by the hundreds in our Philadelphia markets. The two lower figures simply show two of such bouquets taken apart, so that the amount of material can by plainly seen. What can be said of the taste that will prompt people to buy such monstrosities! One might think that many bought them intending to take them apart when they got home, but this is hardly the case, because there is a constant demand for such bouquets, and, too, they are tied so tightly and with so much string that all the life is strangled out of them. We must admit that the purchasers are prompted by a certain love of flowers, but with a taste that has in no way been cultivated.

The flowers cannot be appreciated for their individual beauty, because the clusters are simply a mass of poorly chosen colors. In one of the clusters I counted five rose-buds. How infinitely better it would have been could the stems have been cut a little longer, leaving some of their own beautiful foliage on, and then if there was no pretty little vase at hand, put them in a clean tumbler of pure water. H. H. BATTLES.

STAKING ROSES

New York.

Roses are coming in very freely, too freely, in fact, for the requirements of the dealers, who find as yet but scant encouragement from their customers to lay in much of a daily stock. The spell of very warm weather is responsible in part for the overproduction, but beyond that is the very apparent fact that the growers are in too much of a hurry, and the unavoidable conviction that the wholesale men are largely to blame for this. For already has begun the annual frantic struggle of the commission men for the big consignors, and the growers would be something more than human if they were not strongly tempted to take full advantage of the situation. Yet in the long run this condition of things is bound to result in disaster, which must be borne sometimes by a few, oftener by the many, as has been demonstrated in New York on more than one occasion in the past.

When it is true (and there seems to be no doubt it is at present) that commission dealers are paying daily to their growers money for thousands of roses that have come to market only to find their way to the dump-cart, all because of the ill-advised and over-zealous competition of the commission men and the ready acquiescence of the growers, it is time for all hands to keep a watch-out and bear in mind that two and two never did make six and four and four never can make twelve.

The quality of roses coming in is very fine for the season. This is especially true of American Beauties, which several growers are doing remarkably well. Cusins, La France, Wattevilles, and Meteors are all first-rate. Of Mermets there are very few decent ones to be had. There is a good supply of long-stemmed carnations, particularly the Grace Wilder, which bids fair to again be a general favorite among carnation buyers.

A few single violets of good quality for the season are coming in from College Point. Smilax is abundant and dahlias and gladioluses realize scarcely enough to pay the freight.

In one window in Broadway is to be seen a nice row of ericas and a few orchids, but in general florists are as yet paying little attention towards making their windows attractive, relying mainly upon a few palms, ferns, and decorative foliage plants.

Preparations for the great Madison Square Garden chrysanthemum show are rapidly progressing, and the list of patrons is lengthening out in a most encouraging manner.

Among recent arrivals from trans-Atlantic vacations are Winfried Rolker, William Elliott, George Stumpp, A. Jahn, and Miss Burgess, and now only remains Charles Thorley, who is expected to arrive about October 1.

Auctioneer Elliott proposes to commence his regular sales on September 22. He is not in love with English weather. He says it was a constant fight against the rain and fog, and that the first article he bought after landing was an umbrella, which was his constant companion during his stay. He was particularly disgusted by the frequent aspersions upon American weather which he heard over there, and says he couldn't be induced to live there, even if tied with a big chain.

Robert B. Young had an extensive auction sale of foliage plants on September 18, from Siebrecht & Wadley, James Taplin, and the Jersey growers. The audience was not large to start with, but Bob took hold with patient persistence and managed to keep cheerful in spite of the fact that he was crippled up with rheumatism, and finally worked them up to pretty fair prices for much of the stuff.

The Bowling Club of the New York Florist Club holds regular fortnightly meetings for practice. They don't intend to be caught napping next summer.

Mr. August Rolker has been confined to his home for a week by illness, and is threatened with typhoid fever.

Mr. and Mrs. Ellison, of St. Louis, have been visiting here for a few weeks.

When Charlie Weathered and Jim the Penman again appear in public they will each carry a vigorous full beard, which they are now nursing with great care. Charlie says his object is to lengthen his features, which he asserts are entirely too round, while Jim gives as his motive a desire to broaden his face, which he claims is far too thin. Here's hoping that they both get suited.

Boston.

Fisher Bros. & Co., of Montvale, exhibited at Horticultural Hall recently a new form of Adiantum cuneatum, which originated from seed at their place. The foliage is finely cut into irregular shreds, presenting a very peculiar appearance. Fisher Bros. have a big stock of splendid adiantums for winter cutting, and a couple of houses of grapes which are almost ready. They made a big strike on Blanche Ferry sweet peas the past season.

The silver plate prize offered by Peter Henderson & Co. for a collection of annuals which was not awarded at the annual exhibition of the Mass. Hort. Society has been re-offered for the best six blooms of Louis Boehmer chrysanthemums, to be exhibited at the Boston show next November. The premium is valued at $25.

The cut flower commission business which has been carried on for so many years in Boston by Wm. J. Stewart, has been sold out to Lucius T. Peck and Geo. A. Sutherland, both of whom have been employes in the establishment for a num-

MARKET BOUQUETS—HOW NOT TO DO IT.

ber of years, and who start in business under most favorable auspices.

Mr. P. Welch, of the firm of Welch Bros., is quite sick, having been indisposed since before the Toronto meeting. His many friends will wish him a speedy recovery.

Mr. C. M. Atkinson, gardener to Mr. John L. Gardner, is also reported as seriously ill.

The annual exhibition of fruits and vegetables was held at Horticultural Hall on September 15, 16, and 17. Both halls were well filled with an unusually attractive exhibition. The collections of pears were very large, occupying almost the entire space of the upper hall. A most interesting display of the wild fruits of all countries was made by Jackson Dawson. There were over 100 kinds, comprising pyrus, prunus, and berberis in great variety, besides many rare and showy things. Many of the varieties were very beautiful, and the masses of coral, crimson, blue, and gold fruits could scarcely be excelled in brilliancy by any display of cut flowers. On the last day of the exhibition eight superb blooms of Cereus triangularis were received from the Harvard Botanic Garden and proved a great attraction.

The Village Improvement Association of the town of Winchester, a suburb of Boston, successfully opened the first horticultural exhibition ever held in the town on September 17. Many creditable exhibits of the products of Winchester in wild and cultivated flowers, plants, fruits, and vegetables were shown, including the plants grown by the children from seeds given them by the association last spring, for which premiums were offered, and in which there has been much enthusiasm shown by the little ones. Mr. Robert Farquhar delivered an interesting address to the children.

Mr. Samuel Henshaw, of Thompson, Conn., paid a flying visit to the fruit and vegetable show. He brought with him the finest variety of zinnias that have ever been seen here, which he says are the product of seed imported by R. & J. Farquhar, of Foston. There are two or three very striking new colors among them. Mr. Henshaw is an enthusiast in aquatics, and has several hundreds of seedling nymphæas in his hands, one of which, a seedling from N. nucipheron, he describes as a beautiful yellow, larger than N. marliacea chromatella. Aquatics have a big future.

Philadelphia.

The last few days have been very warm, forcing on the roses quite rapidly. The demand is increasing, however, and really good stock meets with ready sale. Shonbrun violets are now in, put up in bunches of 25 in each and sell for $3 a hundred. Tuberoses are finer this year than we have ever seen them before. There is a great sale for them at 5 cents a stalk. They wholesale for $3 a hundred.

George Campbell has sold his city store and stock to the Floral Exchange, of 618 Chestnut street, who will run this as a branch store. The Floral Exchange is owned by gentlemen whose names do not appear in the business but who are engaged in other pursuits and reputed to be very wealthy. They have a large range of greenhouses near Bristol, Pa., and endeavor to raise all the stock they need.

The building fever is still on, and new houses are reported in various parts of the city. W. Shellum has erected three houses on Gray's lane near Woodlawn avenue, and W. Alburger, his neighbor, has added a fine three-quarter span 100 feet long.

W. K. Harris is busily engaged moving stock to his new place. The doors of the greenhouses here opening into the shed are hung to swing either way and have no latches, this is quite an improvement on the old way when one carrying a box has to rest it on some thing to open the door. We noticed that some of the tables were being given a coating of mortar and cement, thus adding to their durability.

C. A. Knapp of Mermaid Station, Chestnut Hill, has erected a carnation house 80x20 and replaced his heating apparatus with a 50-horse power boiler.

Mr. Shields, the nominee of the republican party for the office of register of wills,

learned the florist business with Louis Bowman (now deceased) of Germantown. Mr. Shields soon tired of the business and has been for some time employed in the Register's office. As the salary and fees of the position amount to something like seventy-five thousand dollars a year Mr. Shields, if elected, may not be sorry that he laid aside the coal shovel and the watering can, and while the trade has lost on the one hand, they certainly ought to gain on the other, for with this income Mr. Shields will no doubt be able to gratify the love for flowers that first turned his attention to the business.

D. D. L. Farson has been seen on the alleys at the club room frequently of late and it is whispered that he has the Washington bee in his bonnet. X.

Chicago.

The weather is exciting the ire of all the growers. The dry summer has seriously checked plants in the field. Then the cold days and nights we had the early part of this month were an apparent warning of early frost and carnations were hurried into the houses and preparations made to "fire up." But the weather changed without warning and old Sol did some "firing up" that completely cast in the shade anything from a greenhouse boiler and for the last ten days stock has been under glass subject to a scorching sun.

The sudden change from abnormally cool to almost tropical heat has thrown such a stock of roses on the market as has not been seen at this season for many a year. The inevitable consequence follows in a totally demoralized trade. Roses which a week ago readily commanded $3 per 100 can now be bought at from $1 to $2.

Although roses are a perfect glut, carnations remain very scarce, the demand for good flowers exceeding the supply.

The first violets of the season were seen last Saturday and considering the season they were of fair quality. Owing no doubt in part to the hot weather trade is quiet.

Mr. O. P. Bassett of Hinsdale is cutting some splendid American Beauty roses of very deep color. His Duchess of Albany are also unusually well colored.

World's Fair matters are moving along briskly now. It was considered impracticable to change the location of the Horticultural Building as desired by Mr. Thorpe, but to accommodate the display he desires to make in front of the building the lagoon will be filled in so as to give him the space needed. Mr. Thorpe is well satisfied with this solution of the difficulty and it is pleasing to see the progress that is now being made in the work on the building. Mr. J. H. Laing, of John Laing & Sons, London, called on Mr. Thorpe last week and asked for space to make an exhibit of tuberous begonias. They propose to exhibit 10,000 plants. Chief Samuels of the Horticultural Department is in Washington this week attending the meeting of the American Pomological Society.

Battery D has been secured for holding the November exhibition of the Horticultural Society of Chicago and the committee of arrangements is now hard at work on the final details. Copies of the premium list, with a number of valuable specials that have been offered since the advance sheet was issued, will be printed and mailed shortly and advertising matter circulated. All the members of the society are very enthusiastic over the exhibition and it promises to be very decidedly in advance of any ever before given in this city. There was some talk of changing the date to a week earlier, but after full consideration it was decided to make no change.

The annual meeting of the Horticultural Society will be held in the club room of the Sherman House the afternoon of Saturday, October 3. At this meeting the proposed by-laws will be considered and there will be read a paper on "Orchids from the amateurs standpoint," by Mr. W. H. Chadwick, and one on a subject not yet determined by Mr. Jonathan Periam.

Messrs. Benthey, Curran, Hauswirth and Smyth were the recipients of numerous compliments on their work in arranging the decorations at the recent banquet. It is to be regretted that some of the members of the club received notice of the affair just too late to enable them to get to town in time to be present.

Last Saturday awards were made on the plant and cut flower exhibits at the exposition. John C. Ure took most of the plant premiums; M. F. Gallagher those for table designs, carnations and roses; J. C. Vaughan those for dahlias and gladioli. John Thorpe, Edgar Sanders and John Sell acted as judges.

Among recent visitors to the city were Mr. J. D. Carmody, of Evansville, Ind.; Mr. Paul Berkowitz, of H. Bayersdorfer & Co., Philadelphia.; and Mr. Carlos Liebert, Mexico City.

Superintendent Pettigrew of Lincoln Park has gone to Vicksburg, Miss., to attend the funeral of a relative.

Toronto.

The Gardeners' and Florists' Club held its first meeting since the convention on the 9th inst. Votes of thanks to the various persons who had assisted the club in any way, and congratulations that all the proceedings had passed off so well, were the order of the evening, and, with the exception of a lively passage of words between President Chambers and Treasurer Gilchrist, everything passed off with its usual harmony and vivacity. All accounts in connection with the convention were ordered to be paid, and the finance committee asked to bring in a statement of affairs next meeting.

Chrysanthemum show matters, also, were up for discussion, and the club resolved to stick to the one judge system (one for plants and one for flowers) and judge by points. The show will be held in the Horticultural Pavilion. Prices of admission to be 25 cents for adults, 10 cents for children. These prices seem to make most money in this city; both higher and lower have been tried, but with indifferent success. The experience of other clubs on this vexed, but all important subject might be interesting and instructive.

"Canada's great fair," held annually, in Toronto, at the Exhibition Grounds, is now in full swing, and the city is filled to overflowing with the agricultural community from way-back. Truly, we are getting a goodly share of visitors this year. There is a horticultural show in connection with this fair, but the writer, not having yet attended, is unable to speak intelligently concerning it. I hear, however, that from various causes which would not interest your readers, the display is rather meagre. Mr. Chambers, Park Superintentendent, Mr. Geo. Reeves, of Reservoir Park, and Messrs. Manton Bros., of Eglinton, are the principal exhibitors of plants. I believe I cannot say that I quite enjoy this fall fair flower show; it seems to have a rather depressing effect on one's nerves to see some one (who may be, perhaps, an excellent judge of turnips or mangel wurtzel) come up and squeeze a palm leaf maybe, and then smell his or her fingers, and then there are all the "Oh! how lovely," before a huge table bouquet resplendent with scarlet, pink, blue, and yellow, &c., &c., and nothing is allowed to be sold on the grounds to relieve the depression except tea and coffee. E.

OBITUARY.

CHARLES P. ANDERSON.

Charles P. Anderson, who has been well known for years as one of the leading rose growers for the New York market, died at his home in Flushing, L. I., on Wednesday evening, September 16, aged 46 years.

Mr. Anderson was born in Sheffield, England. His first horticultural training was at the establishment of B. S. Williams, from which he went to Kew Gardens, where he remained about four years. He came to this country when 21 years of age. He first entered the employ of Isaac Buchanan, afterward serving at an establishment in Elizabeth, N. J., and a private place up the Hudson, from which he went to T. J. Slaughter's rose-growing establishment at Madison, N. J., where he first became prominently known in the New York cut flower market. In 1883 he left Mr. Slaughter to take a responsible position with Mr. John Henderson, at Flushing, L. I., which position he retained until recently. During the years of his service with Mr. Henderson, that establishment came to the front as one of the leading rose-producing places in this country.

Mr. Anderson was a man of fine physique and commanding presence, of manly deportment and exceedingly well informed in his chosen business. He stood high in the esteem of his associates in the trade as a man of rare intelligence and sterling honor, whom to know was to respect. His advice was always sound and good, and no one could spend an hour in his company without feeling that his time had been well used, and that he had learned something of value from an honest man, of whose friendship one might well be proud. He was a strong and enthusiastic supporter of the S. A. F. in its earlier years, and has always been a regular attendant upon its annual conventions. The death three years ago of his employer and friend, Mr. John Henderson, to whom he was devotedly attached, affected him greatly, and the loss of so good a friend at that time undoubtedly aggravated and hastened the unfortunate change in his health and deportment, the loss of ambition and failure of intellect, which was becoming apparent to his friends, which he did not appear to have the power to stay, and which resulted later in his withdrawal from business and now in his death. It is impossible to forget or overlook the sad features connected with the blotting out of such a life at the very meridian of manhood, with opportunities and prospects such as rarely come to the lot of those engaged in our business, and the expressions of all those in the trade here when apprised of the sad event have been uniformly those of sorrow and regret.

The funeral on Sunday, 20th inst., was largely attended by the members of the N. Y. Florist Club, the president-elect and secretary of the S. A. F., and many of his associates in the trade. The pall bearers, selected from the members of the N. Y. Florist Club, were: Messrs. Jas. Dean,

Alex. Burns, W. S. Allen, Jas. Raynor, Theo. Roehrs, and J. Dann.

The tribute of the Florist Club was a beautiful anchor of roses, with base of lily of the valley. The interment was at Greenwood cemetery.

Mr. Anderson leaves a widow, two sons and one daughter. Among other men prominent in the trade who were present were Messrs. Brogan, Asmus, Trumpy, Wethered and others.

Milwaukee, Wis.

The Wisconsin Florists' and Gardeners' Club enjoyed an excursion September 8 from Milwaukee to Sheboygan, Wis., in response to an invitation from Mr. Otto Schucht. There was a large four-horse 'bus full of ladies and gentlemen who left Milwaukee on the morning train. The journey was very pleasant along the lake shore and we were met at the depot by Mr. Schucht, who gave us a ride out to his new place now in course of construction, where we were ushered to a pair of large tables well laden with good things.

After refreshments we were given a pleasant drive through the principal streets of the city and were surprised to note its thriftiness, improvements and growth in all lines; it was gratifying to the florists to see the taste displayed in beautiful lawns, trees and flowers and that our host's progress was second to no other line of industry. This assertion is made with full knowledge of the fact that a brewery as well as other important enterprises flourish there. The pansies in his garden were unusually fine; after our July and August heat it was a surprise to find such large and well colored flowers. The beds of seedling geraniums were interesting, particularly the one which our party decided to call Mrs. O. Schucht, a variegated variety, white stems, center of leaves white with green edge. Another indication of advancement was the practical demonstration of the fact that weeds are not essential to a florist's establishment. We frequently hear how lonesome a smoker becomes without his tobacco; I'm afraid some of us were guilty of the same unhealthy feeling in missing the weeds.

The new houses are being built on an elevation overlooking the city to the east, with Lake Michigan in the background, forming a beautiful picture. Although the improvements are but partially completed it was manifest that Mr. S. was aware that next to utility comes beauty among the essentials to a well arranged florist's establishment. Just at supper time we arrived at a small park, where we spent the evening eating, singing, speaking and dancing, returning home by moonlight. C. B. W.

Syracuse, N. Y.

The Central New York Horticultural Society has just been awarded two valuable prizes for fruit at the State Fair, held here Sept. 10 to 17. One was first prize, of $200, for largest and best collection of fruit especially designed for family purposes, collected and exhibited by any society or organization which has been in existence at least one year, and second prize, of $100, for largest and best collection of fruits especially designed for market purposes.

The first collection contained the following varieties: Apples 145, pears 80, plums 36, hot-house grapes 12, native grapes 40, peaches and nectarines 15, besides red and white currants, red and black raspberries, gooseberries, persimmons, bananas, grape fruit and several other varieties of rare fruit from Florida and California. The judges expressed themselves highly pleased with both collections, which were the finest ever seen in this part of the State, and, as the majority of the fruit was grown in this immediate vicinity, Syracusans feel proud of the honor. The society owes a deep debt of gratitude to its able president Mr. A. D. Perry, who has been most indefatigable in getting the collection together, and has spared neither time or pains to accomplish the object. With this money in the treasury the society will be greatly strengthened.

Messrs. P. R. Quinlan & Co. had a fine exhibit of palms and foliage plants, and were awarded the prizes in these classes. Several other members of the society secured prizes for plants, fruits, flowers and vegetables.

Messrs. Smiths & Powell had a very fine display of fruit from their extensive nurseries, not for competition. The judges' awards have not been made public at this writing.

The premium list for the fall show will soon be in the hands of the printer.

H. Y.

Detroit, Mich.

In the horticultural department of the Detroit Agricultural Fair and Exposition, which closed September 4, John Breitmeyer & Sons took first prize on table design, decoration and bouquets; the Detroit Floral Co. on general designs and baskets of flowers; Chas. Warncke on Rex begonias and on four flower beds of plants arranged in the exhibition hall. He also exhibited a floral design in the form of an owl of large size made of roses and asters. Geo. A. Heinl of Toledo, O., was the judge.

John Breitmeyer & Sons are building two houses 200x20 each, for roses, and one 100x20 for general stock.

Holznagle & Noel are building two houses 100x18 each, for chrysanthemums. They intend to have some fine plants at the coming exhibition in Chicago.

A. W. Steincke is building two houses for general stock, and Andrew Ferguson is adding a violet house, the largest in the city.

Society of Minnesota Florists.

The above society held its annual meeting at White Bear Lake, Thursday, September 10. Officers for the ensuing year were elected as follows: E. Nagel, Minneapolis, president; Aug. S. Swanson, St. Paul, vice president; R. Wessling, Minneapolis, secretary; E. Venzke, St. Paul, treasurer; executive committee: J. C. Sten, St. Paul; Edmund Behrens, St. Paul; Jacob Hartman, Minneapolis.

The afternoon was devoted to sociability and fishing. A bowling match was arranged and played by teams made up of St. Paul and Minneapolis members, the Minneapolis team winning the game. The attendance was not large, but all present heartily enjoyed themselves. Another match will soon be played by the teams from the two cities. R. W.

LANSING, MICH.—The displays of plants and flowers at the recent state fair were very creditable. The principal prize takers were Crabb & Hunter, Grand Rapids; Joseph B. Blessing, Jackson, and R. Mann & Son and C. S. Fitzsimmons, of Lansing.

SOUTH NORWALK, CONN.—Miss M. E. Adams has erected a greenhouse, with office attached, for commercial purposes.

News Notes.

BOSKOOP, HOLLAND.—Mr. P. Ouwerkerk sailed on the steamer Rotterdam September 9, for his annual business trip in America.

SOUTH BEND, IND.—Mr. Wm. D. Rettie, of the firm of Treanor & Rettie, the florists, was united in marriage September 9, to Miss Ida Treanor.

NEW BRITAIN, CONN.—The Hort. Society is making arrangements to hold a chrysanthemum show November 10 to 12. A premium list is now being prepared.

BUFFALO.—The premiums offered for competition at the November exhibition of the Buffalo Florists' Club amount to $816.50. The exhibition will be held in Music Hall.

NEWARK, N. J.—In making arrangements for the annual fair of the State Agricultural Society, to be held at Waverly, the society has decided to add a floral and horticultural exhibit.

DETROIT.—Exhibition plants for the coming show are looking well. The musical features of the show will be something of a departure. Various musical clubs and societies have been made interested in the show, and a different organization will furnish music each evening.

LEXINGTON, KY.—At the Bourbon Co. Fair, Florist W. S. Bell, of this city, took premiums on the following displays: Largest and finest display of foliage and greenhouse plants; greatest variety of ferns; greatest variety of foliage plants; finest display of caladiums, and finest display of palms.

CINCINNATI.—Owners of property adjacent to the site of the proposed flower market are delaying the work on that much needed structure. The florists have, however, retained counsel, and will fight the matter through, so that the benefits of the Holroyd bequest shall not be lost to them and to the city.

ELIZABETH, N. J.—The Elizabeth Hort. Society gave an exhibition of asters recently that was very interesting. Early in the spring the society distributed over 500 packages of aster seed among the children of this city and vicinity, and the exhibition was of the flowers grown from this seed. Many of the flowers reflected much credit on the youthful growers. The sum of $50 was awarded in premiums.

QUEBEC, CANADA.—The September exhibition of the Quebec Horticultural Society was very successful, the display being excellent and the attendance much larger than on former occasions. A departure was made in holding the exhibition in large tents on the esplanade. Those receiving first premiums were: Messrs. Thomas Todd, Alex. Sinclair, H. Meyer, J. E. Monaghan, J. O'Neil, David Bell, Miss Ecuyer, Jacques Verret, and H. Gowen.

HARTFORD, CONN.—The display of plants and flowers at the fall exhibition of the Hartford County Hort. Society was very creditable. W. B. May received first prizes for "best display of greenhouse and stove plants;" "best collection of palms," and "best collection of ferns." Premiums were also awarded to Mrs. A. Nash for asters, to A. N. Pierson, of Cromwell, for tuberous-rooted begonias, and to J. H. Bardain for collection of seedling gloxinias.

The Color Question.

Having a deep interest in this attempt to settle the color question, I would like to give some of my ideas and if they do not quite agree with someone else's opinion, they are not given to arouse any ill-feeling, but as the ideas of one individual who is prone to mistakes, like nearly all humanity.

I think the different ideas and opinions on this subject need to be brought out and there is certainly need of much study upon it to bring harmony out of confusion, such as now exists in descriptive catalogues. It will be no small task, and will take a long time yet, but if we work together patiently, and try to be helpful to each other, the matter will take much less time to settle and be a deal more satisfactory to all concerned.

Why not let the colors in dry goods be unnoticed until we have studied more faithfully the colors in Nature's paint-box, and then with our box of primary colors study what the composite shades are made from and let the predominating color give the main part of the name, as: Blue green, yellow green, or gray green in dark, light or medium shades.

In the color red, I think scarlet should be the basis to work from in making all the shades of red and pink, and Salvia splendens fills my idea of scarlet. Now take a bit of scarlet and dabble yellow with it, and you get the shades ranging down to orange, and by a skillful use of the yellow and white paint working upon the red, comes the various shades of salmon pink. Now go back to your scarlet and mix a bit of blue with it, and behold! You no longer have anything you can call scarlet, but if the red predominates it is crimson, and under this head comes carmine and majenta; lighten this with white, and you get the shades of pink in the sweet peas, and that class of pink shades; add more blue, and then comes a new color to be transformed into the many puzzling and much misused shades of purple, heliotrope, lavender, mauve, etc., which may all be headed under purple as the basis. We find goods in the shops called heliotrope and old rose that are no such colors or shades as were ever found in either of these flowers, and I doubt if in any other flower.

Now take up the color blue; one gets easily confused if they do not draw a line between clear blue, and blue mixed with red; blue is no longer blue when the red is with it. Although in many flowers it will look decidedly blue as they are placed by some contrasting color in the yellow or orange shades. There are pansies that seem to me a true blue, but I think if they were placed beside a true blue color the purple would seem to predominate in them. I know of but very few flowers that I think true blue, but there may be many that I have not seen. There are said to be blue sweet peas, blue asters, verbenas and ageratum. I can only say, they are not blue to me, but one of the shades of purple. To me the sky is true blue when the atmosphere is clear and the sun is high.

The yellow and orange shades are well represented in the marigolds and tropæolums, but when you say tropæolum yellow, who is going to know what shade you mean, for the lightest, darkest, and all intermediate shades are found in this variety of flowers, and also in the marigolds.

Then come the various shades of green, blue green, yellow green, gray green, red, bronze, etc., according as some color predominates, and yet the basis is green and composed of two distinct colors.

We are "looking through a glass darkly" now, but let us study and work, and by and by a new light will come upon our work and we shall all be wiser and happier. L. S.

SITUATIONS, WANTS, FOR SALE.

Advertisements under this head will be inserted at the rate of 10 cents a line (seven words) each insertion. Cash must accompany order. Plant advs. not admitted under this head.

SITUATION WANTED—By a gardener and florist; 9 years' experience Private place preferred
A. J. Box 533, Lake Geneva, Wis.

SITUATION WANTED—By a gardener, competent in every branch of the business—private place—will take charge. Address M, care Am Florist.

SITUATION WANTED—By young man 20 years of age; had 5 years' experience in greenhouse work; can give good references. Address
A. S. NICOL, Kingston, Pa.

SITUATION WANTED—By landscape gardener and florist; age 25; commercial or private, near Chicago. References. J. NORMANN,
Kaye's Park, Lake Geneva, Wis.

SITUATION WANTED—By a Scotchman of 20 years' experience in growing roses, and all sorts of first-class florist work; single; best of references. Address GARDENER, box 262, Stoughton, Mass.

SITUATION WANTED—To put up steam or water heating apparatus in greenhouses. Or will work by contract. Thoroughly experienced. Address CHAS. EICHENBAUM, 742 N. Ashland Ave., Chicago.

SITUATION WANTED—By a first-class florist; German, single, age 24 years; thorough knowledge of all branches; growing roses, carnations, palms, propagating, cut flowers, and chrysanthemums for exhibition. Southern or western state preferred. Best references. Address
F G. care American Florist Chicago.

SITUATION WANTED—By a good all round man as manager, florist's or private establishment; 25 years practice, private and commercial in England and America. Successful plantsman and cut flower grower; also quick and tasteful at floral work. Abstainer; married, one child. Address
FLORIST, P. O., Victoria, B. C. Canada.

SITUATION WANTED—By gardener of executive ability and experience of all requisites and routine of commercial place, inside and outside operation, general propagation, successful growing of cut flowers, roses, pot plants, accessories to the nurseries, etc. Address
HORTICULTURAL, care American Florist.

SITUATION WANTED—By a first-class florist and gardener; German; 10 years' experience in growing roses, carnations, ferns and all kinds of other plants. Good cut flower worker and decorator. Very industrious; honest; first-class references; as head gardener on private or commercial place. Address G. F. DIEZ, care Schemof & Schubart,
Wheeling, West Va.

WANTED—To lease or buy greenhouses, dwelling and land near good market. Address
H WISE, Mt. Prospect Ave., Newark, N. J.

WANTED—New or second-hand steam heater suitable for use in a factory. Address, stating capacity etc. S. M. ISBELL & Co., Jackson, Mich.

WANTED IMMEDIATELY—A small hot water boiler, to heat 600 feet 4-inch pipe. State price. J. GOODE & Co., cor. 53rd St. and Kimbark Ave.,
Hyde Park, Chicago.

WANTED—A thoroughly competent rose grower, capable of managing a large establishment. Apply HORTICOLE,
Grand Central Hotel, New York City.

WANTED—Young man about 20 with some experience in greenhouse work, to board with owner. State experience and wages expected. Address
FLORIST, 490 South State St., Elgin Ill.

Grand Central Hotel New York City.

FOR SALE AT A BARGAIN.

A first-class business in a live town near St Paul. Houses well stocked with everything needed for the coming season. Must be sold through sudden illness. Proof, profits last season over $1,000 Two-thirds purchase money can remain on long time at 6 per cent. Address X, care American Florist.

A SPLENDID OPPORTUNITY.

WANTED Not a pretender; not a bag of wind; not a fancy man at fancy salary; not one who says "yes I know it all"; and then puts in 300,000 cuttings and has only 25,000 Roses to show for a whole year's work I want a MAN in every sense of the term; a good sensible, honest, sober, industrious and thoroughly reliable man One ready to show that he can grow H. P., climbing, moss and tea roses in large quantities The right man can have a LIFE job and in time an interest in a growing business. Address with references,
FRANKLIN, care American Florist.

A CARD.

PUBLISHERS AM. FLORIST:

The advertisement I sent you to sell a No. 6 Furman boiler has brought such a flood of inquiries as to why I want to sell it, and what is the matter with it, that I am afraid it is giving the public a bad impression as to its qualities, and thereby, to some extent, damaging the manufacturers. I wish it distinctly understood in justice to the manufacturers as well as to the good qualities of the Furman boiler that it is all they claim for it; and my only reason for selling it is I am putting in one large one that will do the work of three small ones, thereby saving the labor of feeding three furnaces and making one do all the work.

I will say in distinctly understood that the Fu man is the best boiler I ever had in every sense of the word, and that the Furman Manufacturing Co. are the most liberal gentlemen to deal with I have met in 50 years' experience. Yours truly,
GEO. HINMAN, Atlanta, Ga.

IN OUR LAST issue appeared a request for opinions as to the advisability of the organization of an American Carnation Society. We trust that the expression of opinion will be full and complete. That there is work for such a society to do none will doubt; the only question is, can such a society now be placed upon an enduring foundation, and is the number of strictly carnation growers large enough to make the society what it ought to be? Whatever is done, let the foundation be laid right, and this can be done only by working from carefully formulated plans. Think the matter over well and talk it over well before a meeting for organization is held and be prepared to submit a well digested plan for consideration. We shall be pleased to hear from any of our readers on this subject.

VARIEGATED-FLOWERED MORNING GLORIES.—Mrs. H. M. Hickcox, Chariton, Ia., has sent us some very distinctly carnation-striped blossoms of a morning glory. While the striping of these flowers is unusually well defined, there is nothing new in the variegation; striped dwarf growing morning glories have been in cultivation for years, but never become popular because of the inconstancy in the variegation, but Mrs. Hickcox writes us that the one from which she sends flowers is a free climbing vine the same as Convolvulus major and not a dwarf grower.

A SPECIMEN flower of their new hibiscus, "Crimson Eye," is sent us by Messrs. Wm. F. Bassett & Son, Hammonton, N. J. The flower is very large, in color white, with crimson eye, and decidedly bold and striking in appearance. Mr. Bassett writes that it comes true from seed, and that some of the flowers measure over eight inches across when fully developed.

THE Association of American Cemetery Superintendents, which was confronted by a deficit of nearly $100 at the Boston convention, now has a balance of $260 in the treasury. In a recent report the secretary speaks of the Chicago convention as the most successful session of the association.

"READER OF FLORIST" will find the information desired regarding the forcing of Roman hyacinths for Christmas in a communication from Mr. W. Scott, that appeared on page 620 of our issue for March 26 last (No. 147.)

THE notes on "New plants in Canada" that appeared on page 126 of last issue were from the pen of Mr. Wm. Falconer. The signature was accidentally left out.

ALWAYS mention the AMERICAN FLORIST when writing to advertisers.

Catalogues Received.

The Seed Trade.

AM. SEED TRADE ASSOCIATION.

F. BARTELDES, Lawrence, Kan., president; A. L. DON, New York, secretary and treasurer. The tenth annual meeting at Hartford, Conn., second Tuesday in June, 1892. Applications for membership should be addressed to Wm. Meggatt, chairman membership committee, Wethersfield, Conn.

Failure of James Vick, Seedsman.

This event, while not entirely unexpected in the American trade, is too important not to create a decided sensation, both in this country and Europe, and must be a matter of general regret. We give below extracts from the Rochester papers covering such details as the press of that city were able to secure.

The liabilities are divided about as follows:

Flour City savings bank	$ 75,000
First mortgage held by the Mutual Life Insurance company upon the seed-house property	34,000
Due Ezra R. Andrews on notes	12,000
Other liabilities, about	54,000
Total (estimated)	$175,000

The estimated assets are divided about as follows:

Seed house land on East avenue	$ 10,000
Buildings	40,000
Seed house farm property	30,000
Personal property	40,000
Accounts, stock, good will of business, and miscellaneous assets	50,000
Total	$240,000

According to this there is about $50,000 due to the seed trade fraternity, considerable of it to foreign houses.

The immediate cause of the closing up of affairs and the appointment of a receiver was the recording on September 9 of the Flour City Bank's mortgage of $85,000. When this became a matter of public record several suits were immediately commenced.

James Vick carried on the seed business which bears his name for many years, but the corporation was organized as recently as 1885. Some of its principal stockholders are James Vick, Frank H. Vick, Charles H. Vick, and William Stewart.

Up to a few days ago it was confidently expected by the members of the corporation that the Flour City Bank, which had carried them through several years, would again extend its accommodation. Last week they notified the bank that they would like to extend their line of discounts. The bank was unwilling to do this without further security. Neither the Vicks nor the gentleman who had been backing them heretofore were able to do this, and the bank considered that while it was now amply secured, it did not care to venture further. The seed season is over for the present year, and there will be little or no income until next spring. The Vicks were unable to obtain money to tide over the crisis, and their notes began to go to protest. To cap the climax the bank filed a chattel mortgage for $85,000 and has just levied upon the property. E. R. Andrews, another creditor to the amount of $12,000 for printing, has also levied on all the bulbs, seeds and roots at the seed establishment, a quantity of paper stock under attachment at E. R. Andrews' office, a number of horses and wagons and a quantity of nursery stock on the Vick farm at Brighton, and on the nursery stock on a farm in the town of Greece belonging to the corporation.

James Vick, as an individual, and perhaps one or more of his brothers will carry on the business and will take care of all orders and preserve the good will of customers. If an advantageous sale is made of the real estate, a farm will be purchased for greenhouse purposes farther out from the city and its taxes. The Vicks have been land poor for years. They have been given promises of backing when they start in on a new basis.

At a meeting of the corporation September 17 the three directors, Frank H. Vick, Charles H. Vick and James Vick, all resigned in order that there might be nothing to hinder the placing of the entire assets in the hands of the supreme court. Frank H. Vick also resigned his position as president of the corporation, Charles H. Vick as secretary, and James Vick as treasurer. Selden S. Brown was selected to act as attorney for the corporation, and Joseph B. Fuller, an employe of the concern at the East avenue seed house, as the person on whom papers are to be served.

On September 18 Porter M. French, an attorney, was appointed receiver under bonds of $50,000.

The many friends of Mr. Joseph B. Fuller, the veteran manager of the vegetable seed department, will regret to learn that he is a creditor to the amount of about $4000.

Lima Beans in California.

Whatever California undertakes is usually done on a gigantic scale, and this is not less true of her seed crops than of other enterprises there. A few details as to the cultivation of Lima beans in the Santa Barbara district may interest the seed trade. The quantity of seed used per acre is from 25 to 35 pounds, planted 3 feet apart, from which a yield may be expected of from 1,000 to 2,500 pounds per acre. The crop of 1890 was estimated at 1,000 car loads of 20,000 pounds per car. The crop of 1891 is estimated at 2,000 car loads—one grower having planted this year in one piece 1,300 acres. This crop is estimated at over 100 car loads. Of course these beans are not trained but allowed to run over the ground and when in full growth form a waving sea of foliage standing 3 to 4 feet high. In harvesting the crop a V shaped implement is used, consisting of two boards about 5 feet long and 12 inches wide, shod with steel shear runners and a rolling coulter made from a circular saw is set in the front end of this V. This coulter cuts the vines and the two side runners separate them into winrows. The rear of each runner has projecting iron arms with five teeth to shake off the dirt from the vines. Henderson's Lima bean has proved too small for a profitable market crop, and Burpee's new Lima has not yet been experimented with.

THE ALLEGED power of camphor to awaken seeds, or stimulate their germination, has been shown by the experiments of M. Henry de Varigny to have no real existence. Various kinds of seed were sown in sand saturated with water containing camphor, as advised by horticulturists, and the germination of all was slower, instead of more rapid, than that of similar seeds in water without camphor. Germination was even retarded by camphor vapor in the air, the water having no camphor.

MR. ERNST MUELLER, for many years in the employ of J. C. Schmidt, seedsman and florist, Erfurt, now succeeds to that business. Mr. M. is well known to the horticultural trade of Europe and America, and has the best wishes of all for his success.

VISITED CHICAGO: J. C. Bowman, of Barteldes & Co., Denver; S. B. Dicks, London; W. B. Hayt, of Cleveland Seed Co.; Robert Livingston.

THE SUPPLY of dormant Roman hyacinth bulbs both in Europe and America seems about exhausted.

The "Tale of Woe"

In regard to the retail dealers' "tale of woe," go in a dry goods store or grocery in a small town, say where there is some floral trade, and watch awhile and see how often the customer expects to get something extra when they trade. I think it will be found in all retail trade, and it might be said to have originated in the chromo business. People have learned to expect more than they pay for and the merchants, to get trade, have gotten up the baking powder and other such baits, and now the people expect if they buy one flower you will give them two, and you are stingy if you say you cannot do so. I have many such customers, and I find they are satisfied and come again to buy if you positively refuse to give extras with a small order. L. S.

Six Working Days Enough.

Referring to the very interesting article in your issue of the 10th inst., read by Mr. Wm. H. Long at the Toronto convention, I would like to add my appreciation of its contents in general, and in particular to its positive opinion that the florist business may be conducted in six days with closed stores and greenhouses on Sundays, except in cases of necessity in ventilating, etc., giving one full day's rest to themselves and employes. I am presuming that Mr. Long has put his advice into practice, and can give satisfactory evidence as a successful business man. If there are more that carry out this practice it would be well to make it known for the encouragement of others to adopt this rule, who are now held under the slavish rule of custom.

WHY You Should Grow Mushrooms.
Because they are the most profitable crop for the outlay that can be grown and may be grown without interfering with other crops. The market is sure, the supply never having been equal to demand.

WHEN You Should Grow Mushrooms.
During the Winter and Spring months, the first planting in August or September with successional planting until April.

WHERE You Should Grow Mushrooms.
Under the greenhouse benches, on the greenhouse benches among growing crops, in Rose Houses, in frames in the greenhouse, in cellars, stables or outhouses, in the open field or in mushroom houses.

HOW You Should Grow Mushrooms.

First get spawn that will grow. It must be fresh, well spawned, and in good condition. **Gardiner's Celebrated English Mushroom Spawn** is the best, and is always fresh and reliable. The details of culture are given concisely in our treatise, **"Mushrooms for the Million,"** Mailed free. **Falconer's "Mushrooms and How to Grow Them."** Published at $1 50. (Gardiner's price $1 35 post free.) **Robinson's "Mushroom Culture,"** 50 cts. postpaid.

GARDINER'S ENGLISH MUSHROOM SPAWN.
John Gardiner & Co., have made a specialty of choice spawn for years, and their celebrated English brand (made by the best maker in England, specially for their trade), has gained an enviable reputation among critical growers for its uniform good quality, and can be thoroughly relied on to produce a good crop of the best mushrooms. Orders booked now for delivery as wanted, $8.00 per 100 lbs. Special rates to large growers. Address all correspondence to **21 North Thirteenth Street,** Philadelphia, Pa.

J. Horace McFarland,
. HARRISBURG, PA.

San Francisco.

At the semi-annual meeting of the Florists' Club of California, held September 4, the attendance was, says the *California Fruit Grower*, large, and the meeting was harmonious and enthusiastic. The following officers were elected for the ensuing year: President, Emory E. Smith; vice president, F. Shiveley; recording secretary, M. H. Wilkens; financial secretary, C. W. Shaw; treasurer, Joseph Carbone; directors, G. E. Robinson, H. B. McGowen, S. H. Selling, and E. J. Poyal. The president announced that the petition of the Florist Club asking that a license be placed upon street peddlers of cut flowers, plants, seeds and bulbs had been duly presented to the board of supervisors, and that an argument had been made before the license committee, with the result that the recommendation had been immediately made that each peddler be required to take out a license of $10 per quarter. This was thought by the society to be too little, and a committee was appointed to wait upon the mayor and various supervisors to, if possible, have the amount raised before the measure was presented to the board of supervisors for adoption. A petition for presentation to the park commissioners asking that the practice of giving cut flowers and loaning plants to private individuals be discontinued, was read and approved. The subjects for discussion at the next meeting are "Second-Hand Wire Frames" and "Funeral Solicitors." The Florists' Club, which is composed of the growers and dealers in cut flowers and plants in the bay region, bids fair to be one of the most active and beneficial floral organizations in the country. It is very gratifying to see trade prejudices dying out, and good fellowship and unity of purpose on the increase.

Pandanus Veitchii and P. Javanicus var.

Please describe in the FLORIST the difference between Pandanus Veitchii and P. javanicus var. I have bought both varieties for Veitchii. WESTERNER.

[The leaves of Pandanus Veitchii are much broader and shorter than those of P. Javanicus var., and are also somewhat less pendulous. When in good condition the variegation of the latter species is as clear as that of P. Veitchii, though it does not retain its coloring as well, nor does it make as symmetrical a plant as P. Veitchii. There is also a striking difference in the spines of these two species, which may be ascertained by drawing the hand up the leaves from base to point, as the spines on the midrib of P. Javanicus are reversed, whereas those of P. Veitchii all project in one direction.—W. H. T.]

Elmira, N. Y.

The great interstate fair, which was held at this place from September 1 to 9, was one of the most successful exhibitions ever held here. One of the most attractive features of the fair was Floral Hall, a large building devoted only to plants, cut flowers and design work. Rawson "the florist" occupied two-thirds of the space with a most magnificent display of most everything that grows in the way of flowers, but chief among this display were roses and carnations. It was to be regretted that the season would not permit a showing of his Marie Louise violets, which "Great Scott" stoutly maintains will cover a silver dollar. Mr. Rawson captured twenty-one first premiums—nearly a clean sweep. Owing to the increased demand for summer roses Mr. Rawson will this fall erect a new house 245 feet long for summer roses. F. W. THE CHEAPEST AND BEST OF ALL.
FIR-TREE OIL
INSECTICIDE—soluble.

FOR PLANTS.—To make a solution for washing or cleansing purposes—Half-a-Pint of Fir-Tree Oil to ten gallons of water.

For Green and Black Fly, Thrip, American Blight, Wooly Aphis, etc.—Half-a-pint of the Fir-Tree Oil to two or four gallons of water, or two or three tablespoonfuls to the pint.

For Red Spider and Caterpillar—Half-a-pint of the Fir-Tree Oil to two gallons of water, or three tablespoonfuls to the pint.

For Mealy Bug, Brown or White Scale—Half-a-Pint of the Fir-Tree Oil to four or six quarts of water, four to eight tablespoonfuls to the pint.

For Mildew and Blight on Fruit or Foliage—Half-a-Pint of the Fir-Tree Oil to a gallon of water, or six tablespoonfuls to the pint.

Used with warm water it is quicker in its action than when cold is used.

Soft or rain water is necessary, and Applied in Wood, Tin or Pot Vessels.—Galvanized Iron Vessels must not be used.

FOR ANIMALS.—For Skin Diseases and Killing Vermin mix one part of Fir-Tree Oil with three parts of warm water and wet the affected part each day. In some cases it may be used stronger. For Ring-worm apply full strength with a brush each day.

FOR BIRDS INFECTED WITH PARASITES.—Put a tablespoonful of Fir-Tree Oil in one quart of warm water and dip the bird in it, taking care that its eyes are protected, hold the bird in one hand for one minute, then dip into clean tepid water; this may be repeated. If necessary a much weaker solution may be used with a spray producer.

Sold in Bottles and Tins.

A. ROLKER & SONS, NEW YORK.

DOUBLE RUSSIAN VIOLET.
HARDY VARIETY FOR OPEN-GROUND CULTURE.

We have much pleasure in now offering this hardy Violet, grown by Mr. R. J. Donovan.

This Violet has been grown at Chicago for 5 years, planted in open ground with no protection beyond covering the beds in late fall with forest tree leaves. The soil is very sandy—too poor to grow geraniums, somewhat shaded by large trees.

From a bed 150 feet by 4 feet wide, Mr. D. sold the crop of 34,000 flowers at wholesale in Chicago for $204.00.

The style and habit of the plant is similar to M. Louise. The leaves, however, are less smooth or glaucous. Flowers large, very double, deliciously fragrant, and of a very deep shade of blue—darker than M. Louise—one or two petals in each flower being dotted with red.

The season for cutting lasts about four weeks, commencing here in April lasting well on into May. Mr. D. estimated the profits at 90%, the labor and care being but a trifle.

PRICE:

Dozen	**$ 1.50**
Per 100	**8.00**
Per 1000	**70.00**

Mention American Florist.

Indianapolis, Ind.

During the past summer and spring there have been added several new florists' establishments and several additions to the already numerous greenhouses around the city. Mr. T. P. Haughey, banker, Martin Brennlein, florist, two houses 60x20; Hugo Goltz, florist for Hasselman, reports that they will build two more houses for cut flowers and heat all by hot water; John Hartje has added two medium-sized houses for carnation cut flowers; John Vondersaar has moved to Madison avenue, near the Belt—four houses in all now; Weishaar Bros. have sold out their stock and will build some distance in the country southeast of the city; Alfred Pahud has added one house 20x80 and one 10x80, and intends to build one more before cold weather; Henry Rieman has added one house for carnation cut flowers; Bertermann Bros. have added one house for 'mums and forcing stuff; Mrs. Butsch, at Irvington, will move onto her own property and build entirely new; F. C. Huntington & Co. have remodeled their entire store and warehouse; they report an excellent trade in fall seeds and a very good spring business.

A great interest is being taken in our fifth annual chrysanthemum show. Some new features will be added and a great show will certainly be held. Committee met here Thursday, September 17.

Summer business has been unusually quiet. It must certainly pick up soon. Weather for the last two weeks has been perfect, and hopes are entertained that the usual September frosts may keep away for some time. W. B.

When writing to advertisers please mention the fact that you were induced to write by the advertisement in the American Florist. You will benefit us by letting advertisers know that it is the Florist that is bringing them trade.

AHEAD OF EVERYTHING.

We Follow None, Prize or No Prize.

Our latest improvements in machinery produce a Standard Pot which for lightness, smoothness and durability, has never been equaled. Customers buying of us will

SAVE ONE-THIRD IN FREIGHT.

And to prove this, we give below a table showing number in Crate and WEIGHT of same, which speaks for itself:

Size.	No. in Crate.	Weight.
1¾-inch	3,000	250 lbs.
2 "	2,400	250 "
2¼ "	1,750	250 "
2½ "	1,450	250 "
3 "	1,280	350 "
3½ "	800	350 "
4 "	600	350 "

It will be seen at a glance, that our pots are one-third lighter than formerly, and yet we claim that owing to the superior quality of our clay and improved machinery, they are stronger than any pot in the market, and we frankly ask you to make the test. ☞ SEND FOR PRICES.

New greenhouses 180

ONE OF THE Colorado members of the Board of Lady Managers of the World's Fair has started a movement to make an exhibit of the wild flowers of that state at the great exposition, and ladies from all over the state are taking a great interest in the project. The result of such enterprises can not be other than an increased interest in flowers, both wild and cultivated, and a greatly increased familiarity with our own wildlings.

The Artistic Grouping of Flowers.

I.

We have discussed in several previous issues of the AMERICAN FLORIST the color arrangement of flowers; inseparable from this is the art of grouping them artistically.

Undoubtedly we all of us differ in opinion more or less, not only about what colors look best together among flowers, but also about the actual arrangement of the flowers themselves. I feel myself at times considerably shaken in my views on the subject by being brought face to face with flower groupings or paintings of them, so foreign to what happened to be my own preconceived notion, that I have been constrained either to modify my opinions or else to study the matter from a different point of view. Thus, in one of the art galleries of New York last winter, a certain artist showed by his pictures exhibited there a striking preference for the color effect he found in cabbage beds!

Now, I never supposed there could be anything very lovely in the color effect observable in a cabbage bed! Leastwise, as an artist I should not wish to devote my time to the study of this very estimable vegetable. Yet I have found that there is something well worth our study here. There is a blue in the shadow of a cabbage leaf on a summer's day when the sky is clear, scarcely less beautiful than that we may find in the fringed gentian's cup. There is a green in the young leaf's tip, delicate and pure as that in the curling sea wave. In truth, if we did but know it, by the very form and arrangement of the cabbage leaf there is produced a play of color at once charming and refined; a range of blues from sapphire to turquoise, and from turquoise blue through lovely cool green to Nile green and a topaz yellow, almost rainbow-like! And this lovely color effect is in part produced by the natural grouping of the cabbage leaves! It is a lesson for us, and we shall assuredly find that in the studied grouping of our flowers we will produce effects of color at once unattainable except through their artistic arrangement.

It is the positivism of color in most flowers which makes it necessary to arrange them with the greatest deference to their appearance "en masse."

I expect shortly to attend a county fair. I have had some experience in these agricultural fairs, and I know just what to expect when I enter the room where the flowers are on exhibition.

Every flower and leaf will be "arranged" to the last point of distraction! Without doubt a great deal of time will be expended in this arrangement; probably many of the ladies in the town will exercise their taste in the filling of vases and jars. But with what result? Here, you will find purple dahlias and the brightest yellow marigolds, mixed in the stiffest order with sprays of yellow golden rod and blue asters. There you will see masses of scarlet and crimson gladioli sticking straight up out of beds of variegated nasturtiums. Yonder are zinnias of all colors, arranged with painful precision among stacks of cut geraniums and candytuft, and beside us are some glorious dahlias, bereft of every bit of green, jammed together in the stiffest and primmest order in a large circular dish, around which the flowers form rings of violent, though gorgeous color—red, yellow, purple and white!

All this is simply dreadful. It is dreadful to some of us; to others, who do not know exactly what is the matter, it is confusing and uncomfortable. In point of fact, if we can find anyone who expresses any admiration for the flowers we shall find ourselves listening to the praise, not of the flower groups, but of the individual form and color of a simple bloom here or there! This is all because the flower groups were not properly arranged. The more lavish the flower bloom we have at hand for decoration, the less excuse we have for ugly and stiff arrangements. As I have had occasion to say before, the less variety and complexity of color we have in our groups the better. I have before me a variety of "old rose" pink nasturtium, which I am convinced must be absolutely alone if it would look its best. That dainty pale straw-colored variety called the Pearl ought not to be injured by the society of the commoner yellow variety. King Theodore in his gorgeous red velvet looks richest to me massed alone! However, the chameleon variety and those which are considerably variegated look very well mixed together; again, we must not forget the green leaf, but dispose it gracefully in the group.

Zinnias are predisposed to stiffness if not carefully grouped, but the greatest injury may be done this flower by inconsiderately combining its various colors in one group. Those growing in my garden are magnificent in color and variety. They are æsthetic as well as brilliant in tone. Some folks consider them homely, but I should think to the florist they would offer opportunities of rich and subdued color for decoration purposes only excelled by the chrysanthemum. Everything depends upon the grouping of the zinnia. They ought to be disposed gracefully in a large, cylindrical Japanese vase, yellow and white or blue and white, as the case may be, or else in a tall jar of one color in plain glaze. Here is a chance for crimson and scarlet effects, and for rusty and dull flesh tones, but again that rich wine-colored variety resembling the Cullingfordii chrysanthemum must be alone to give its best effect. The pink blooms, also, must not come in contact with the scarlet ones; better keep that variety of rich old subdued pink for a special vase. Then again, the colonial

yellow ones ought to be placed with the white or cream-colored variety. It seems to me that the zinnia ought not to be mixed with any other flower. I do not say that this should follow as a rule, for there are no doubt excellent combinations of the bold zinnia with other fall flowers, which would prove, on the contrary, quite æsthetic and beautiful. There is, however, a certain charm in the staunch green stem with its flaring leaf which ought not to be hidden by other unnecessary flowers. Without its stem being in full view the zinnia loses half its charm.

This brings me at once to what I want to say about the flower stem in the flower group.

Florists are becoming more and more convinced of the necessity of showing the stem and foliage of a flower in order to profit by its full beauty. What could be more graceful and beautiful in curve and line than the stem and leaf of the Catherine Mermet rose? What more luxuriant in color and outline than the foliage of the Cullingfordii chrysanthemum? The same will hold true of dahlias, zinnias, asters, and hollyhocks. In my estimation one-half the beauty of these fall flowers depends upon the judicious arrangement of their stems and foliage.

It does not seem appropriate, nor does it seem in any way necessary to the beauty of a group of tall flowers to hide their green with a mass of short-stemmed bloom in great variety, just for the sake of using up a goodly number of flowers. The nasturtiums are dainty little creatures and ought to be seen in dainty places, by all means near the eye, but hollyhocks and zinnias ought to be placed in conspicuous places in tall array, and in position and arrangement calculated to display their decorative quality.

That so-called careless or natural and artistic arrangement of flowers on long stems has more than "a method" in its composition. It is usually "a study." And the artist who paints his group of flowers by skill attains the apparently careless positions they hold. There is always a central, full-faced flower, with perfect foliage; then there is one not so large and not so perfect, holding a subordinate position near it; next there is a good large bloom placed in profile at the edge of the group, and not far from this, and maybe just below the central blossom, there is a three-quarter-faced flower; a graceful stem is sure to be placed somewhere in sight, and disposed here and there near the top of the group will be some buds, showing themselves in profile.

Thus the group of flowers, apparently careless in arrangement, is actually disposed in fashion regulated by strict rule; and the artist or florist accustomed to work out his artistic effects in this simple but absolutely careful way unconsciously follows the rule, forgets all about it and each touch of his deft fingers brings his work nearer and nearer to the perfection nature is always reaching after, but never completely attains. I shall have more to say on this subject later. F. SCHUYLER MATHEWS.

Tuberous-rooted Begonias at Mr. T. Griffin's Nursery, Westbury, L. I.

The nursery is on what we call the Hempstead Plains and almost quite level, and on account of contiguous buildings, trees, fences and the like fairly well sheltered all about. The soil is very rich on a gravelly subsoil and it has been heavily manured. The beds are long parallel oblong squares of the common nursery type and with narrow pathways between them. The begonias had been planted in rows crosswise in the beds and about nine inches to a foot apart, and now are a solid mass of luxuriant foliage and a brilliant display of blossoms.

Of course all the plants reserved from last year were used again this season, but the great majority of the plants are from seed this year. The principal sowing was made last January in a small warm propagating house and others at intervals later on as the young plants could be conveniently handled. Soon after germinating the seedlings were pricked off into flats and when they had grown a little bigger replanted into other flats further apart and in richer soil and here they remained till planting out time in May. In this way it will be seen all the plants set out are good leafy stock and there are no dormant bulbs; the old bulbs are always started well into growth in pots or flats in the greenhouse or frames before they are committed to the open ground, hence there are no gaps, no failures in the beds in summer.

The most critical time in the life of a begonia is in its early seedling stage. The seeds although very small have great vitality and germinate readily, but the seedlings are exceedingly apt to damp off when they are between one and four weeks old; carry them safely through this period and their further growth is easy enough.

During the summer months Mr. Griffin never allowed his plants to suffer from drouth, for water was handy and abundant and he used it unstintedly. But never water begonias overhead when the sun is shining on them, else you will scald them, and don't water them when the surface of the ground is hot in the daytime, as it generally is early in the afternoon, else the plants may rot off at the neck, but apply the water late in the afternoon or evening.

Mr. Griffin's begonias consist of both single and double-flowered varieties. The singles are large, wide open flowers 3 to 5 inches across; the doubles are less in width, but massive with high full-double centers. Sometimes the doubling is an aggregation of flowerheads set in one bunch as we often find in double cinerarias or daisies, but he prefers the rose-doubles, that is when the doubling is in the form of one bloom, as a hollyhock or zinnia.

While large size is an objective point fine form is also wanted and he is encouraging a type with prettily and undulated edged petals. In color the flowers are white, fair yellow, mostly lemon shades, amber, pink of several tones, flaming scarlets and deep crimson, with many variations, and a fancy type, like Marseilles poppies, has white flowers with pink edges, or pink flowers with white margins.

The behavior of these plants as we saw them in the open air beds was very encouraging. The main block of beds was right in the open field and unshaded by anything. The beds showed no gaps and the plants were 10 to 20 inches high and very luxuriant, with fine bold foliage and a mass throughout of brilliant blossoms. And the types of plants as raised from seed, for instance, crimsons, yellows, pinks, whites, doubles or singles, were very marked and constant, but in the growth of the plants there was some unevenness, showing that in very particular flower bed gardening one year old plants whose size is already known had better be used rather than first year seedlings, whose bulk of growth cannot be very well foreseen.

A large mass of these begonias planted in beds slightly shaded by trees showed all the luxuriance and floriferousness of those grown in the open block and undoubtedly are far superior for such a position to geraniums of any sort.

Mr. Griffin is now filling up his greenhouses with the finest varieties for seeding purposes, for they do not ripen seed well out of doors. He lifts them with good roots and balls of earth as one would carnations and plants them on benches, touching close together in light airy houses. Although the plants are in full growth and bloom when lifted, they feel the check very little. They are kept perfectly dry overhead and the atmosphere of the house dry to induce seed ripening. And most all of the fine flowers are cross fertilized by hand.

The other begonias are left outside till frost nips the foliage, when they are cut over close to the ground and the bulbs lifted and stored inside over winter. Keep them in a cool temperature, say 40°.

WM. FALCONER.

Bed of Tuberous Begonias.

The accompanying illustration is from a photograph of a bed of tuberous begonias on the grounds of Mrs. Robert Pitcairn, Pittsburg, Pa., sent us by Mr. J. Wilkinson Elliott, of that city.

Mr. Elliott writes: "The begonias were planted out June 1 last, and from the 20th of that month have been a mass of flowers and foliage, and all who have seen them admit they make the handsomest bed of flowers ever seen in this city. The plants have had good care, but not better than the numerous fine beds of bedding plants on the same grounds, and I think they pretty effectually answer the question as to whether tuberous begonias can be successfully bedded or not. The bed is 80 feet long and 8 feet wide at the broadest portion. The greater part of the bed has full exposure to the sun, but one end is quite shaded, and this end is the poorest part of the bed. The plants in the shade are vigorous enough, but do not produce as many or as fine flowers as where fully exposed to the sun. Mr. Thomas Fitzgerald is the gardener in charge of Mrs. Pitcairn's place, which is one of the notably fine ones of this city The photograph was taken Sept. 7."

Gymnogrammes.

The so-called "Gold" and "Silver" ferns included in this genus form a most interesting group, though their fronds are rather too delicate in most instances to allow of their extended use as trade ferns.

For certain purposes, however, some of the gymnogrammes may be used with good effect, and on the score of beauty they should find a place in every collection of ferns, and when once established in a collection there is usually little difficulty in keeping up the stock, as most of the species are very easily reproduced.

The majority of the members of this genus are best suited under warm house treatment, though this is by no means necessary for all, a temperature of 55° being enough for many of these, providing reasonable care be given in the matter of watering. In the matters of culture and propagation there is no difficulty found with the present genus, though in order to keep the foliage in good condition it should not be watered overhead, else one of the chief beauties of some of the species, that is the farinose powder, will be washed off.

Spores are produced in large quantities by these ferns, and also germinate freely, and as the seedlings often present slight

BED OF TUBEROUS BEGONIAS ON THE GROUNDS OF MRS. ROBERT PITCAIRN, PITTSBURG, PA.

variations from the type it makes the family an interesting one with which to experiment.

Among those specially noted as either gold or silver ferns there are frequent variations of coloring seen, and while some of the seedlings present the same brilliancy of coloring as the parent plant, others will be found bearing much less of the farniose powder on their fronds, or else the latter of a different shade and shape.

Probably the most beautiful of the golden ferns is G. Laucheana, the long and graceful fronds of which are thickly covered with deep yellow powder on the under side, and as this plant is a strong growing variety a good sized specimen may soon be secured.

G. Parsonsii is another good one, and belongs to the same group as the above, but differs much in appearance from the fact that its fronds are quite heavily crested on the tips. This is a remarkably handsome variety, and deserves a little extra care in watering.

G. decomposita is still another from the gold-leaved section, and a larger grower than either of the preceding, its fronds being frequently three feet long, and produced on quite stout footstalks. This species makes quite an effective exhibition specimen when well grown, though as a small plant it is probably not as useful as some of the chrysophylla varieties.

The finest of the silver or white powdered section is G. Peruviana argyrophylla, a compact grower and of graceful habit, and the fronds of which are covered with the powder. This variety enjoys rather more heat than heretofore noted, a temperature of 65° and a moist atmosphere promoting its luxuriant growth.

G. Wettenhalliana is another particularly pretty sort, the fronds of which are very much crested both at their tips and also at the ends of the pinnæ, and are more or less covered with a very pale yellow powder, in fact the latter is almost white on some specimens.

G. schizophylla is also an elegant specimen, the fronds of which are very finely cut and inclined to be pendent, this inclination being increased by the formation of young plants near the apex of the fronds, after the manner of the "Walking-fern." G. schizophylla may be grown in good shape in a basket suspended from the roof of the fern house, and either the type or its improved form, G. schizophylla gloriosa are well worth cultivation.

One species, G. triangularis, is almost hardy, and is a very pretty little fern too, reminding one somewhat of Doryopteris palmata, though more divided and the under side of the fronds being covered with yellow powder. This species seldom grows a foot high and is found on Vancouver's Island and I think also in some portions of the State of Washington.

Holmesburg, Pa. W. H. TAPLIN.

Marantas

These plants orm an extensive genus of very useful and ornamental greenhouse plants, the dwarfer varieties being valuable to the florist for vases and window boxes, while the large varieties are, when well grown, unexcelled for greenhouse decoration. The majority of these plants are handsomely variegated.

Most of the marantas are of easy growth, provided they get a sufficient amount of heat and water while growing, and are kept shaded from the sun. It is a good plan to grow them amongst palms and other large plants, as that gives them shade and moisture and at the same time fills the space underneath the large plants that would otherwise be wasted. The soil should be good, fibrous loam, with a liberal proportion of peat added to it; although it is not essential to have the peat, still they do better in it. The drainage must be good, for while they enjoy liberal watering, still if the drainage is poor, and the soil becomes water-logged, the edges of the leaves turn brown and spoil the beauty of the plant. These plants are easily increased by division of the roots, which may be done at any season of the year, although I prefer to do it in spring.

M. Bachemiana: A dwarf variety of spreading habit, with silvery green leaves, blotched with dark green markings, is one of the most useful for window boxes.

M. Porteana: Is an elegant, erect plant, growing about three feet high. The leaves are oblong, bright green striped with white, the under side of the leaves rich purple.

M. princeps: This is a large growing species, the center of the leaves being a dark, rich green, broadly margined with yellowish green. A very distinct and ornamental species.

M. rosea picta: A beautiful plant of dwarf habit. The leaves are rich, glossy green, the mid-rib rose color and midway between the margin and mid-rib are two irregular bands of the same color traversing the entire length of the leaf.

M. Lindeni: A useful, free growing

variety of dwarf habit. The leaves are oblong in shape and deep green in color, with blotches of yellowish green on each side of the mid-rib; the under side is purplish rose, through which the markings of the upper side are visible, producing a beautiful effect.

M. Veitchii: This superb plant is the most beautiful of the genus. It attains a height of three feet, bearing large, ovate-elliptic leaves upwards of a foot long independent of the foot stalks, the upper surface of a glossy and rich deep green, marked along each side of the mid-rib with blotches of yellow, which is softened by shades of green and white; the under surface is purple, and as the variegation of the upper side shows through upon this ground color, the effect is grand. This magnificent plant should be in every collection of stove plants.

M. zebrina (syn. Calathea zebrina): This is a very old plant, but one of the most useful; it is a tall, strong grower, with leaves of a velvety light green on the upper side, barred with a greenish purple, the under side being a dull purple.

M. Warscewiczii: A strong and vigorous grower, with narrow, ovate leaves, deep velvety green in color, with a stripe of yellowish green on either side of the mid-rib, and which extends from base to point.

There are a great number of other varieties of these plants, all of which are worthy of growth, as they are all highly ornamental and useful greenhouse plants.

Maywood, N. J. JAS. S. TAPLIN.

The French Roses of 1890.

Gustave Regis is here the most popular of the list. It is a fine hybrid tea, much resembling W. A. Richardson in color and form, is semi-double, large, very long bud, canary yellow, saffron center, usually blooming singly, but sometimes in corymbs of three to six flowers. It has a peculiarity of making considerable growth before beginning to bloom.—[American growers claim the flower is too single.—ED.]

Mlle. Christine Noue (Guillot), tea: Although I did not see this rose to advantage, it is very generally liked, very large, double flower, deep red color, with lighter shade center, fragrant, very vigorous and free blooming.

Eliza Fugier: Bonnaire claims a great deal for this new Niphetos, a hybrid of Niphetos and a rose not in commerce. It was not in its glory here when I saw it. He claims the plant to be somewhat more erect than Niphetos, much stronger, and that it does not lose its foliage so much. Flower very similar to Niphetos, but with a slight yellow tint, and very freely produced. This rose has received a silver medal.

Mme. Caroline Testout (Pernet-Ducher): A lively pink hybrid tea, somewhat resembling La France, which is a hybrid, color more brilliant, not quite so double, so that the petals are of a better shape, as vigorous as La France and as free, foliage of good, dark green. They call the color "satiny rosy flesh color," with brighter center, edges of petals pale rose, plant erect and vigorous, fragrant, opens well.

Of the older teas, Mme. Berard, a large double salmon, pinky yellow (indescribable), but shading from salmon to copper, is large, very popular, and much used for hybridizing.

Rose Mme. Carnot (Noisette): Is a pretty thing, medium size, very double, round and opening well, flowers in clusters, golden yellow, deeper in the center, color variable, like Clotilde Soupert.

Mme. Worth (Rugosa): Strong, free blooming, flowers carmine red, dark, fragrant, double.

Kaiserin Augusta: Is a good, white hybrid tea, but very like the Bride.

Grand Duchess Adelaide de Luxemburg: Is a tea, pale yellow, long bud and a good forcing rose.

Miss Clotilde Soupert, at Soupert & Notting's place in Luxemburg, recommends this variety. She also recommends Duchess Marie Salviati, one of their older roses, a kind of chrome yellow shade with flesh pink, cherry center, tea, fragrant, large, double, strong.

The Souperts will surely visit the World's Fair. F. L. V.

Lyon, France, August, 1891.

Seasonable Notes.

Roses for winter flowering, especially the ever-blooming teas, will be growing rapidly if they have had the necessary amount of water during the past few weeks. A critical period in the existence of this section of the rose is approaching. The days are becoming shorter, consequently water must be given with care and judgment, or at the least partial failure will surely result.

It must be borne in mind also that a tea rose which is subjected to a forcing temperature must never be allowed to become dry at the root. That happy medium as regards moisture must be maintained, if fine flowers and lots of them are to be the result.

Nearly every rose grower at some time in his experience has seen a fine looking lot of roses at this time of the year, and during December and January the same roses have presented a sorry appearance. The reason for this is not far to seek—*excessive moisture during the shortening days of the autumn months.*

The "hybrids" for early forcing must be having the finishing touches put upon them in the ripening process. The "how to do this" can only come by experience and keen observation. Water for the past few weeks should have been rigidly withheld, taking care, however, not to allow the plants to shrivel.

"Black Spot," that bane of American Beauty, La France, and that class of roses, must be guarded against. Water the foliage only when there is a probability of its drying off rapidly.

Look out for mildew, and always bear in mind that prevention is better than cure. Take time by the forelock and dust with sulphur or grape dust at least three times a week, and more often if the case seems to warrant it. E. L.

The Rose Cloth of Gold.

As is well known to many in the trade, there are two distinct roses sold for this variety. Some few years ago, to settle the matter of which was the right variety, we sent samples of what we were growing for Cloth of Gold to Hoopes Bros. & Thomas, and also to Ellwanger & Barry. We received replies from both that we were right, Messrs. Hoopes taking the trouble to send us samples of plants that were propagated from stock procured from the late H. B. Ellwanger, well known as authority on roses. We have just received a communication from the Elmwood Nursery, in Tennessee, saying: "There are many of the old roses that ought to be revived—one especially, the 'Cloth of Gold.' When you get the true one it is grand, but nine-tenths of those in commerce now are the 'Solfaterre.' I bought from Buist the true one, I think in 1848, and saw the difference between it and Solfaterre so striking that I cleaned out every plant of the latter. In growth and foliage they look identical, but in color of bloom they are wide apart."

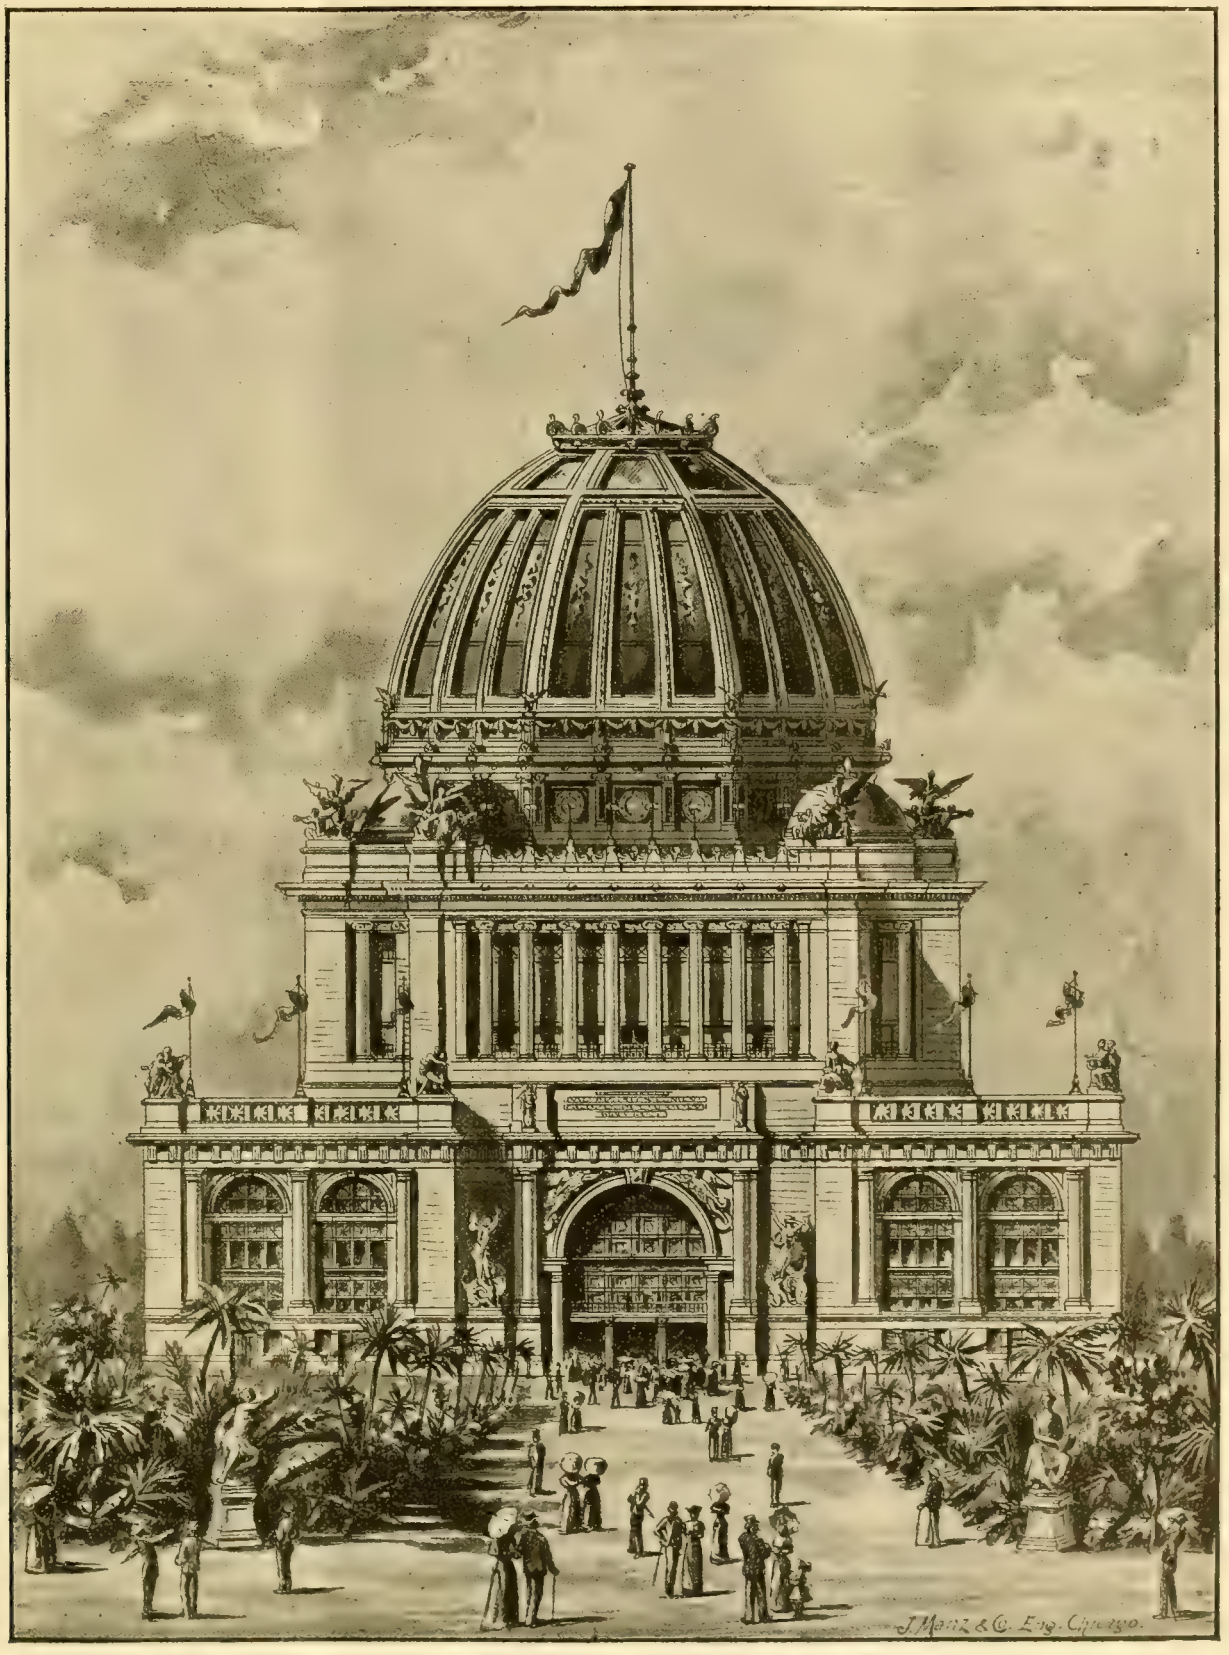
The variety grown by many leading firms resembles Solfaterre in nothing, being of more slender growth, foliage rounder, shyer in blooming and of a much deeper color, resembling Isabella Grey in habit.

There is certainly only one Cloth of Gold, and can anyone settle which is the true variety? J. M. GOOD.

Springfield, O.

Nymphæa Devoniensis, Striped-Flowered.

Through the courtesy of Mr. Jones, the superintendent of the Brooklyn city parks, I had sent to me the other day the strangest freak in the way of a pond lily blossom I ever saw. It was a flower of Nymphæa Devoniensis, cut from a plant growing in a tub in the fountain basin at Brooklyn city hall. The petals were of the typical red color, broadly and decidedly banded lengthwise with pure white. In some of the petals the left hand side was white and the right red, in others the right was white and the left red, and in several while the margins on both sides were red there was a broad band of white along the middle of the petal, and at one side of the flower occurred a few altogether red petals and on the opposite side a few altogether white ones. Mr. John McElvery of Flatbush, L. I., and who is one of the most enthusiastic and successful amateur growers of ornamental aquatics, writes me: "I saw it in bloom in the city hall fountain and it was exceedingly interesting to me, and by the way, Mr. Thompson, the park gardener, tells me that the first bloom produced by this plant this summer was pure white."



By way of exciting their curiosity I cut up the blossom that was sent to me into pieces of a few leaves each and sent them to specialists in aquatic plants with only this information: "How is this?" One gentleman answered by return, "Put a price upon it," another, "I am ready to bid for stock," a third has taken no notice of it. But I have no voice whatever in the matter in anyway, and only mention this to show how important it is to keep one's eyes open to everything that is new among garden plants.

WM. FALCONER.

Administration Building at the World's Fair.

We present in this issue an engraving of the Administration building for the World's Columbian Exposition, at Chicago, in 1893.

This building is the gem of all the architectural jewels of the exposition. Constructed of material to last but two years, it will cost $650,000. Although it covers a space but 250 feet square, yet it is one of the noblest achievements of modern architecture. It will occupy the most commanding position on the exposition grounds. The building consists of

THE ADMINISTRATION BUILDING FOR THE WORLD'S COLUMBIAN EXPOSITION AT CHICAGO IN 1893.

four pavilions, 84 feet square, one at each of the four angles of the square of the plan, and connected by a great central dome 120 feet in diameter and 260 feet high. In the center of each facade is a recess 93 feet wide, within which is a grand entrance to the building. The first story is in the Doric order, of heavy proportions. The second story, with its lofty colonnade, is in the Ionic order. Externally, the design is divided into three principal stages. The first stage consists of the four pavilions, corresponding in height with the buildings grouped about, which are 65 feet high. The second stage is of the same height, and is a continuation of the central rotunda, which is 175 feet square. The third stage is the base of the great dome, 40 feet high and octagonal in form, and the dome itself, rising in graceful lines, richly ornamented with heavily moulded ribs and sculptured panels, and having a large glass skylight. The interior effects will be even more gor-

geous than the exterior, resplendent with carvings, sculptures and immense paintings.

Seasonable Notes.

Now that the heated spell is broken it will necessitate caution in watering, for if we get a long and protracted spell of wet, dark days all chrysanthemums are liable to become water logged. In handling plants in pots be careful to see that the holes in the bottom of the pots are not stopped up through standing on the earth or being filled up by worms.

Where any severe tying up has to be done it should be done immediately, as for instance, when the heads of the standards have to be snug and secure for safe transportation. I do not admire or recommend severe training of the chrysanthemum, but where large plants are grown for exhibition severe tying is more or less necessary.

The constant attention required by chrysanthemums during the next month will doubly repay any labor invested. Attend regularly to the thinning of the buds, which must be kept up, and the tying of the flowers away from danger of drip. Many flowers are disfigured by being pressed up against the roof, the first frost being generally sharp enough to destroy the petals. Tie up all flowers to prevent them from being draggled in the dirt.

As plants begin to come into flower the morning syringing should be dropped, as a dry atmosphere must be had when the flowers are opening. Remember that all deeply-colored flowers should be shaded from the direct sunlight, so as to preserve their brilliancy.

If any signs of cutworms are discovered a very sharp lookout for them should be kept up. They can be found on the plants after dark by the use of a good bright light and a quick eye. In the daytime they are also found pretty nearly close to the stems of the plants and not more than three-quarters of an inch below the surface.

JOHN THORPE.

Insects and Diseases.

Conducted by CHARLES F. BAKER, Agricultural College P. O., Ingham Co., Mich.
Send specimens of unidentified insects and diseased plants to him at above address.

Thrips and Other Insects on Roses.

A communication was lately received from the Brooks Sisters, florists of Sorrento, Fla., in which they stated that the roses in their garden were being badly injured by a very small yellow insect, which worked in the unopened bud. After beginning the attack its depredations soon caused the bud to turn brown and decay, which condition attracted another and larger insect, a beetle. These florists had been troubled by the small yellow insect for over a year. It had occasioned considerable loss, for when even a few of the insects attacked a bud it was ruined. Specimens of the affected roses accompanied the letter.

The damaged roses were carefully examined and large numbers of a small yellow thrips were found. These belong to the family Thripidæ, the members of which may be recognized by the following characteristics: They have four long, narrow, membranous wings which are fringed with long hairs and some times have one or two longitudinal veins; in repose the wings lie along the back. The mouth parts resemble somewhat those of biting insects and somewhat those of sucking insects. The mandibles are bristle like. The body is long and narrow, the head being somewhat narrower than the

thorax. The compound eyes are large and there are three simple eyes. Some forms are wingless. The insects are often very lively, being able to run and jump with great rapidity.

The species in question (see figure) belongs to the genus Limothrips. The body is smooth or glabrous and the last segment of the abdomen in the female is armed with paired spines. The male is wingless. These insects are light yellow in color and one and one-half millimetres (.06 in.) in length. The eyes are black and the distal or outer ends of the joints of the antennæ are tinged with black.

In some cases we find species of thrips—as mentioned by Walsh, Riley and others—which are carnivorous and so beneficial. But many species are quite injurious, as for instance those which affect timothy, June-grass and wheat. A species closely resembling that affecting the rose, is found very common in clover heads. Other species are found in many different flowers. In the rose bud the injury is done around the bases of the petals, causing them to wither and turn brown.

Among the roses sent were found numbers of a small carnivorous bug, Triphleps insidiosus, Say. This is said by Osborn to prey on the thrips. It is thus beneficial and about the only known enemy of thrips. This bug is one and one-half millimetres (.06 in.) in length. The head, thorax and abdomen are black, while the legs and antennæ are light brown. The anterior wings are thickened at the base and thin at the extremities, where they overlap. Each has midway between the extremities a large triangular black spot, the base of the triangle pointing outwards.

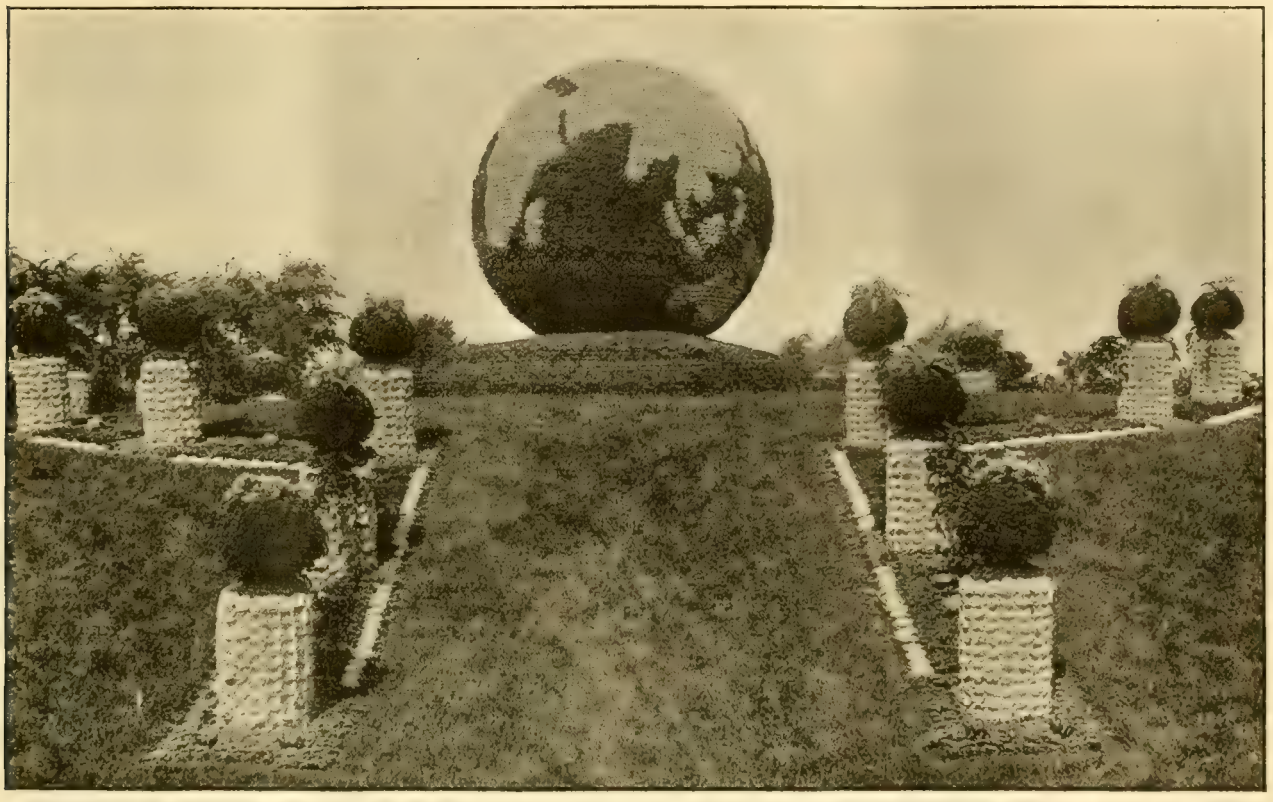
As the rosebuds begin to decay a small beetle takes up its abode among the rotting petals and proceeds to lay eggs, from which small light colored larvæ develop. These larvæ when full grown are four millimetres long and are white, excepting the head and first and last segments, which are yellowish brown. The beetles in considerable numbers and in all stages were found in the roses. Almost all the species of the family to which this beetle belongs, like the rose beetles, feed on decaying vegetable or animal matter and consequently are beneficial. The species found belongs to the genus carpophilus. It is a small beetle, being only two and one-half millimetres (.1 in.) in length. The general color is a light reddish brown, the elytra being a little darker.

No satisfactory remedy has ever been found for thrips. They usually work inside of flower heads and so, especially in the case of the rose buds, would be very hard to get at. Nothing could be dusted or sprayed onto the plants so as to affect the insects, as they would be hid deep down in the folds of the flower or bud and consequently safe from any such remedies. Some remedy applicable in the gaseous form or like tobacco or sulphur fumes in the greenhouse would be much more efficient. In any case pick the buds as soon as they show signs of decay and either burn or throw them into hot water. In the greenhouse this may be supplemented by the thorough application of tobacco and sulphur fumes. In the open air little can be done. The picking might be followed by the continual application of some preventive like a dilute solution of whale oil soap.

A Globe of Plants.

We present herewith a view of "The Globe," one of Superintendent Kanst's most effective designs in fancy bedding at Washington Park, Chicago. The globe is ten feet in diameter and as can be seen in the picture, has the continent delineated in echeverias on a ground of sedum.

Boston.



There is no scarcity of cut flowers in all seasonable varieties. Asters are coming in again quite freely, although the blooms are small. Carnations, which had been very scarce for some time, are abundant and of good quality. Snowdon, Mrs. Fisher, Anna Webb, Grace Wilder, Portia and Century are the varieties most generally seen. Roses are also plenty, especially Mermet, Perle and Gontier. A few Wabans are coming in. The color is splendid, but they are small in size as yet. Tuberoses are very abundant and cheap. For choice flowers there are lily of the valley and stephanotis, with a few lapagerias and orchids. Asparagus plumosa and Adiantum Farleyense are also obtainable for nice work.

The annual meeting for the choice of officers and standing committees of the Mass. Hort. Society will be holden at Horticultural Hall on Saturday, October 3.

Mr. Ed. Welch, of the firm of Welch Bros., has been making merry with his friends over the advent of a daughter.

Chas. Ingram complains of a big, light brown caterpillar which eats the leaves of chrysanthemums. It being a stranger to him, he showed it to the Gypsy Moth Commission, but they do not recognize it. It is very abundant on the weeds and bushes in the vicinity of the greenhouses.

Note in the last number of the FLORIST in reference to one Neal, formerly of New York, Washington, and Chicago, and now supposed to be of San Francisco, awakens fears and forebodings in the hearts of some Boston parties, who have had all the experience they want with that notorious individual, for if he keeps on in his westward progress he will soon be coming up on the other side of the earth again, and it is awful to contemplate the possibility of Boston being in his path.

"THE GLOBE," WASHINGTON PARK, CHICAGO.

Strangers in town: Smith, of Stranraer, Scotland, and Laing, of London, England.

New York.

There is little to commend in the manner of planting the decorative beds in Madison and Union Squares. One feature in Union Square, the basin of aquatic plants, is, however, quite interesting, in spite of the badly arranged border of unkempt coleuses, alternantheras, etc., surrounding it. The nymphæas have bloomed very freely, and on a bright day make a superb show. The waving papyrus and the stately nelumbiums, with their massive foliage and gorgeous red and white blooms, also attract much attention.

Aquatic plants are sure to be more generally grown in the future, and the exhibition of such a group as this, even upon a small scale, will do much to hasten the day when no pleasure ground will be considered complete without them. They should find a place in every public park.

The crisis through which the New York Florist Club passed after the discouraging outcome of the Lenox Lyceum Show last spring has proved to be in some respects "a blessing in disguise," for it served the good purpose of proving who were the real friends of the organization, and showed conclusively to outsiders that the material of which the club was composed was the kind which only laughs at misfortune, and, in spite of discouragement, goes in to win. The croakers, with ill-concealed satisfaction, announced its downfall and predicted that it would never recover from the shock, but on the contrary, the club is stronger to-day than ever before. New members are crowding in, the old ones have taken hold with fresh vigor, and the stability of the organization, both financially and numerically, is now assured beyond question.

A visit to the conservatory of Mr. Hicks Arnold is always interesting. The collection of orchids, while not as large as some, is very valuable, comprising as it does only the rarest and choicest kinds obtainable. The cypripedium collection is very complete, numbering over 175 species and varieties. At present there are not many plants blooming. A magnificent specimen of Angræcum eburneum superbum shows five flower spikes, which when in full flower will be a grand sight. The beautiful Cypripedium Arnoldianum, which received a first-class certificate of merit at Boston last spring, is in bloom again. Vanda Kimballiana and a very dark form of Miltonia Moreliana, are also in good flower at present.

On Mr. Joe Rolker's desk stands a mechanical toy representing two boxers, one in red trunks, the other in blue. When manipulated they do some lively work, the blue one generally coming out ahead. It is not certain whether this is supposed to represent a former horticultural event, or is merely an indication that Joe's boyhood days still linger with him, and that he finds relaxation from business cares in the antics of the two little belligerents.

Elliott's sale on Tuesday, September 22, looked at the opening hour as if it would have a hard struggle for existence, but later on it acquired a fair amount of animation, owing, no doubt, in part to the eloquence of the central figure, and part of the stock went at fair figures. Adiantums went very cheap, and were gobbled up by John Weir, of Brooklyn, who is always on hand in his quiet way when bargains are going.

Mr. Winfried Rolker, whose judgment is generally sound, predicts a great fall and spring trade coming. No one will deny that it is needed.

A Summit grower has a novelty in a sport from Catherine Mermet, with white or very pale stems. In certain combinations the effect of the light colored stems is very pretty.

Philadelphia.

John Dick has rented the greater part of his establishment to the Haley Brothers, who have also purchased a considerable portion of the stock. It was advertised for public sale some time ago, but when the time came round Mr. Dick changed his mind and has since been disposing of his stock privately.

At one time Mr. Dick's nursery was well known all over the country. His stock of camellias was particularly fine when that flower was in favor and his sales of both plants and flowers were very large. Of late years he has turned his attention to real estate and is believed to have been even more successful in this field than in the old one.

The past week the weather has been very warm and as a consequence the flowers have been very plenty. Roses of good quality can be bought for almost any price. The price asked for La France, Brides, Mermets is 3 cents, for Perles, Sunsets and Niphetos 2 cents, Gontiers 1 cent, carnations 1 cent, but no reasonable offer is refused and sales are made away below the "market" price. Beauties are the exception and only fair flowers bring fifteen cents readily.

This same week of last year a firm having a large order for white flowers had very hard work to get together 1,000 roses. On the return of the day this year the order was repeated and at least 5,000 could have been easily obtained without leaving the store. Probably the warm weather is responsible for part of this glut, but surely there are too many roses being brought in now and it really does look as if the fakir is going to have a good time this winter.

A. L. Pennock & Son are building two

iron framed houses 100x20, bedding the sash bars in cement for a wall plate.

Robert Craig is erecting a house 130x20 for carnations and another 100x20 for palms. He is also putting in a large steam boiler to be connected with the range of palm houses recently erected.

Some one ought to show the growers how to do asters. There seems to be a good many about, but they are nearly all done in 4-inch pots and wholesale for from 75 cents to $1 a dozen. We are satisfied that if they would only grow them into a size suitable for a 6-inch pot they would find a market at good prices.

The committee having the chrysanthemum show in hand are working hard and they say the exhibition will be far better than last year, which is saying a great deal. X.

Chicago.

Wm. Brooker, of the firm of Brooker & Holmes, died last Thursday morning, aged 96 years. Mr. Brooker started in the florist business in Chicago at the corner of State and Fifty-ninth streets 34 years ago and has continued at the same location ever since. Though over 60 years of age when he started here, and commencing with comparatively nothing, he died a wealthy man through the great appreciation in value of his real estate. He was undoubtedly the oldest living florist in America.

At Washington Park, Supt. Kanst has introduced a novel feature in the ponds of aquatics by placing the plants in geometrical figures, mainly the eichhornias. The ponds here are all cemented and the margins sharply defined. In one, a well defined border of Eichhornia (Pontederia) crassipes about three feet wide extends entirely around the pond just inside the margin, and in the center the plants are held in a scroll-work design. The eichhornias are in splendid bloom this week, and present a beautiful picture. In a corner of one pond Eichhornia azurea makes a pleasing contrast to the other species. The lilies have done very well this summer, including the victorias, and they have proved a great attraction to the visitors to the park. In one of the greenhouses the alternantheras propagated last spring have been already placed to be carried over the winter, and the way they have been arranged is worthy of note. The benches have been placed in a slanting position, so they grade up from the front to the back, and on these the alternantheras have been planted out in various designs similar to the summer bedding in the parks. The hardy phloxes made a grand display at this park this year and the other hardy perennials have done well. Cuttings from the geraniums and other plants are now in the sand-bed, and preparations are nearly complete for the quick housing of all tender stuff at the first intimation of frost, and the opinion seems to be general that the present hot weather will wind up with a frost.

Mr. F. Kennicott found an evidence of the unusual season in a spray of blossoms on a wild crab-apple tree last week. There were ripe apples on the same branch. Evidently the unusual weather led the tree into the belief that winter had been skipped in some way, and it was time to put out the spring blossoms.

At a banquet given the foreign commissioners to the World's Fair, now in the city, by the Exposition officials, the feature of the floral decorations was the blooms of Victoria regia and other aquatics contributed for the occasion from Lincoln Park. Mr. Thorpe conceived the idea of using these flowers for the purpose and Superintendent Pettigrew cut some splendid flowers from the ponds at the park at his request. Mr. Thorpe secured a number of broad low pans and placed the flowers and leaves in these on tables around the banquet room. The effect was superb and called forth much admiration from those present. And when Mr. Thorpe assured them that the lagoon at the Exposition would be filled with such beauties all united in saying that it would be one of the grandest features of the Fair. The foreign commissioners were especially pleased. That there is a great future before aquatics none can doubt and that they will prove of great value to the florist is equally certain. For evening decorations the night bloomers are especially available, being at their very best at night.

World's Fair matters are moving along briskly. Work on the Horticultural Building is progressing rapidly now, and requests for space in the floricultural division are being received daily by Mr. Thorpe.

At the meeting of the Horticultural Society of Chicago, to be held at the Sherman House next Saturday evening at 8 p. m., occurs the annual election of officers and there will be a very interesting programme of essays. Mr. John Thorpe, Chief of Floriculture for the Fair, will read a paper on "The possibilities of the floricultural display at the World's Fair"; Mr. Wm. H. Chadwick will read an essay on "Exotic orchids" and Mr. Jonathan Periam one on "Horticultural Societies and their growth."

Jensen & Algots have opened a fine retail store at 142 Oakwood Boulevard, one of the best locations on the south side.

The Columbian Floral Co. is the title of a new wholesale cut flower establishment on Wabash Ave., and the Auditorium Floral Co. is the name on the sign which adorns a small glass structure on the corner of Wabash Ave. and Congress St.

Among recent visitors to the city were Messrs. L. L. May, St. Paul; J. D. Carmody, Evansville, Ind.; and the directors of the Telegraph Delivery Association.

Hamilton, Ont.

The fall exhibition of the Horticultural Society and the Gardeners' and Florists' Club working together was a great success, especially when it is considered that only four weeks have elapsed since it was decided to have an exhibition.

There was a total of 1,000 entries, and the exhibits of fruits and vegetables were simply grand. Plants were not so good as they might have been, owing to want of time for preparation; but they were very creditable for plants selected from stock.

Our genial friend, J. H. Dunlop, of Toronto, was on hand with a display of roses, as were also Spears & Muston, and both fully sustained their reputations.

Messrs. G. Vair and G. Reeves, both of Toronto, were the judges of fruit, and they had all they could do from 10 a. m. to 6 p. m., but they did it so well that the directorate have yet to hear the first complaint, even from the chronic kicker, and he is generally on hand in some portion of that department.

The plants and cut flowers were judged by Mr. T. Manton, of Manton Bros., Eglinton, who also gave good satisfaction.

In the classes for plants, S. Aylett received 7 first premiums; John Morley, 3; W. Hunt, 2; F. G. Foster and E. J. Townsend, each, 1.

In the cut flower classes 11 first premiums were awarded to Alex. Reed, 6 to J. L. Harper, 5 to E. G. Brown, 3 to James Ogilvie, 2 each to J. H. Dunlop and T. O. Veale, and 1 each to James Rowe and E. C. Fernside, the last named receiving the first premium for "collection of cut flowers, largest and best display, correctly named." Mr. James Ogilvie received second in this class. G.

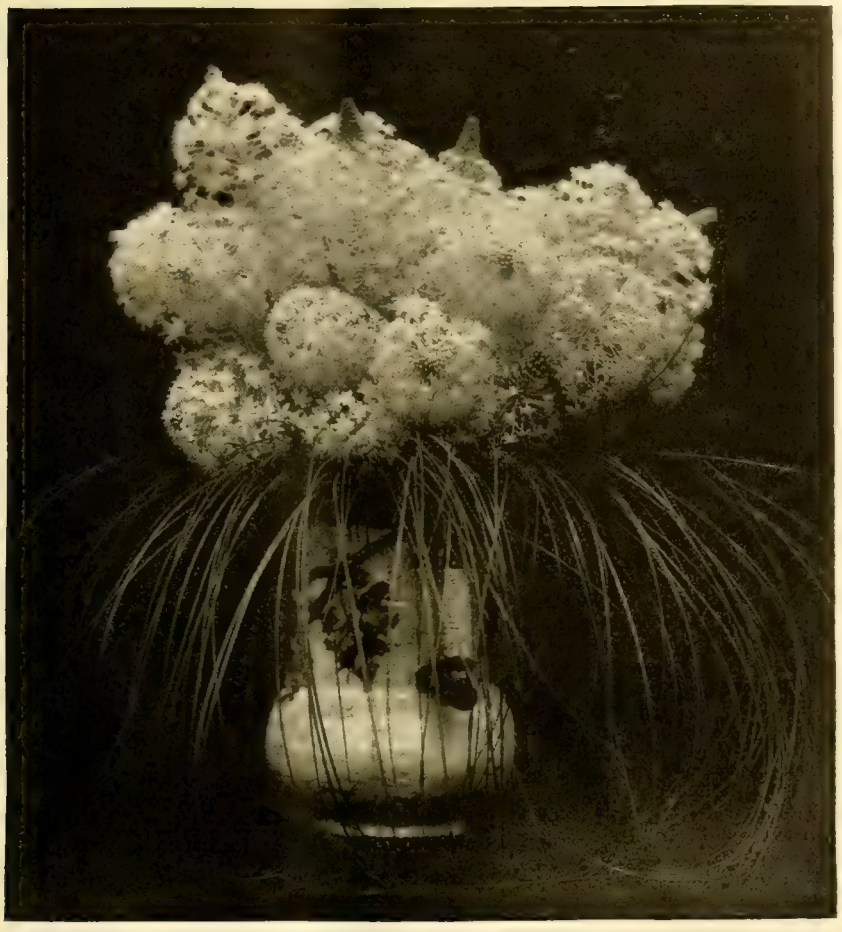
The Telegraph Delivery Association.

The directors of the Florists' International Telegraph Delivery Association held a meeting at Chicago last Monday and Tuesday to perfect the arrangements for the carrying on of the work for which the association was organized.

The plan is to have one member from each city in the United States and Canada and the larger cities abroad who will execute any order sent by members in other cities for flowers or floral arrangements to be delivered to customers then in that city. Such orders are generally telegraphic, hence the name of the association.

The frequency with which orders are now received for flowers to be delivered to people visiting in other cities or on their landing from an ocean trip, etc., opens quite a field for the association, and it will undoubtedly stimulate orders of this kind.

The directors present at the meeting were Messrs. C. B. Whitnall, Milwaukee; H. B. Beatty, Oil City, Pa.; R. J. Mendenhall, Minneapolis; H. A. Siebrecht, New York; Frank Huntsman, Cincinnati. They were in session two days and accomplished a great deal of work. Mr. H. B. Beatty, Oil City, Pa., is secretary of the association.



Heat Regulators.

ED. AM. FLORIST: We have been so thoroughly well pleased with an electrical heat regulator that we placed in our rose house last fall, that I am sure it will interest greenhouse men to hear about it. It is a simple and ingenious device, consisting of a rubber and metal thermostat placed in the center of rose house, and a small battery and spring motor placed in boiler pit. The thermostat can be set at any degree of heat desired. We set it at 56°. (We allow it 1° play.) When the temperature of the house has reached 56½°, a rubber and metal bar on the thermostat expands, touching a pin on one side. This completes an electrical circuit, which causes a half revolution at the motor, closing the bottom draft and opening a large check draft in the chimney, thus checking the fire. When the temperature falls to 55½° the bar contracts, touching on the other side and the electric current causes the motor to open the bottom door and close the check draft. I have visited it at all hours of the night, and am satisfied it is infallible in its operations.

Owing to this uniform temperature our roses were last winter 50 per cent. better than they were the winter previous, with the same care and treatment.

It would be a conservative estimate to place its saving in coal at from 15 to 25 per cent. I have placed my hand on the 12-inch smoke-pipe above check draft and found it quite cool, showing there is absolutely no escape of heat into chimney while check draft is open, which it is 11 hours out of the fourteen, between 5 p. m. and 7 a. m.

Our house I speak of is 102x20, three-quarter span, situated on a bleak eminence.

XEROPHYLLUM ASPHODELOIDES (SETIFOLIUM).
[TURKEY'S BEARD.]

We can leave the house and go to bed free from anxiety lest we should have too much or too little fire on. Its only failure to work, I found on examination, was due to the platinum-pointed screw becoming rusted; this was at once remedied by putting in a new screw. Thereafter when syringing I placed a small starch-box over the thermostat to keep it from contact with the water. This prevented further rusting up to the present time. I am so pleased with it that I will this fall put one on two boilers (can be done if boilers are not too far apart) to regulate a house 120x25.

The price of these regulators is from $50 to $65, according to the cost of application. There is another regulator, not so accurate to the part of a degree, but I believe unaffected by water, which would probably give better satisfaction in very damp houses.

Possibly some of your readers have this regulator in their houses, but as I have never seen anything in print about it you will pardon my taking up so much space. Would be pleased to show it working to florists in my vicinity, and to answer inquiries about it.

R. F. MORRIS,
Gardener to J. C. Rogers, Esq.
Peabody, Mass.

Xerophyllum Asphodeloides (Setifolium).

This very beautiful native herbaceous plant (turkey's beard) was catalogued by a few of our florists last season. Like some other of our native plants however it has been better appreciated in Europe than at home and has been awarded a first class certificate by the Royal Hort. Society of London. The London *Garden* says: "It is one of those old-fashioned plants that are rare in gardens. Two splendid masses were exhibited by Ford Walsingham at the recent royal Botanic Show and were the prettiest things among hardy flowers."

Its roots are tuber-like and have many fibres and its leaves about two feet long, very narrow and in crowns of about 200 clustered around the flower stem and arching backward. The spikes contain about 250 flower buds, which begin to open near the base of the stem, showing about four inches of the head with open flowers at one time and the blooming continues for some weeks. The plant prefers a sandy soil mixed with leaf soil or muck; at the same time it thrives well in the open border or in slightly shaded places.

W. F. B.

Plants in Summer.

I should like to know the best situation, or the best place for cultivating rex begonias, Chinese primroses, cinerarias, etc., during the heat of summer; how best to protect from the heat of the sun. I wish some skilled grower would give his methods through AM. FLORIST.

A SUBSCRIBER.

WHEN writing to advertisers please mention the fact that you were induced to write by the advertisement in the AMERICAN FLORIST. You will benefit us by letting advertisers know that it is the FLORIST that is bringing them trade.

News Notes.

CANTON, O.—Fire did considerable damage to the greenhouses of John Zettler Sept. 1.

NASHVILLE, TENN.—There is talk of a chrysanthemum show here the coming November.

BUFFALO.—Mr. W. J. Palmer, the florist, and Miss Laura Mark will be married next Wednesday evening.

LOUISVILLE, KY.—The dates for the chrysanthemum show have been changed to a week later, viz: November 9 to 14 instead of 2 to 7.

WILLIAMSPORT, PA.—Mr. Harry Chaapel will make his annual trade display and exhibition of chrysanthemums at his store and greenhouses November 11 to 14. The show will be on a larger scale than last season.

AGRICULTURAL COLLEGE, MICH.—Mr. Louis Knapper, who has had charge of the greenhouses here for many years, has resigned, much to the regret of all. He did good work while here and was of that friendly spirit that attached to him all with whom he came in contact. Drs. Kedzie, Beal and Cook have recently returned from Washington, D. C., where they attended the meetings of the American Scientists.

TOLEDO, O.—Geo. A. Heinl has purchased eight acres at West Toledo and is building four houses 100x18 each and 100x12 each, all heated by steam. Mrs. E. Suder is adding four houses 82x20 and 82x17½, with cement walks, and is about to invest in 20 acres at Manhattan, a suburb here, intending to build there. She has also opened a new store at the corner of St. Clair and Adams Sts., under the management of Miss Suder. Robt. Johnston has bought 40 acres at Auburndale and is moving out there, intending to build several houses this fall. J. G. Gartner & Co. have a new house under construction. F. C. Hansen, who is 80 years old, has some rare plants, palms, etc.

A Case of Renaming.

Messrs. Hill & Co. send us a seed envelope which they received from Mr. C. W. Eichling, New Orleans, upon which was written "Sample of Unclesamia papirifera (very scarce). Sure to grow if properly handled." Messrs. Hill & Co. advise us that the envelope contained a $2 bill that accompanied an order. But when the envelope reached us the "sample" had been carefully removed, hence we can not very well say anything as to its merits. However the name sounds well and we hope that Mr. Eichling not only has a good stock but that he will handle it so properly that the growth and increase will be equal to the demand.

DIRECTORY CHANGE.—Erase the name of Geo. W. Marshall from the directory list at Chelsea, Mass. Mr. Marshall is on the list at Everitt, Mass. also and is getting a double allowance of catalogues and price lists. He gets mail from both offices, but Everitt is the most convenient one for him.

A FLASH LIGHT PHOTOGRAPH of a plant of Phyllocactus latifrons, bearing 26 open flowers, has been sent us by Mr. Joel W. Goldsby, Mobile, Ala. The plant was grown in the open air by Mr. F. Bitzer of Mobile and the photograph was taken the night of August 18 last.

THE AMERICAN FLORIST

Subscription $1.00 a Year. To Europe, $2.00.

Advertisements, 10 Cents a Line, Agate; Inch, $1.40; Column, $14.00. Cash with Order.

No Special Position Guaranteed.

Discounts, 6 times, 5 per cent; 13 times, 10 per cent; 26 times, 20 per cent; 52 times, 30 per cent. No reduction made for large space.

The Advertising Department of the AMERICAN FLORIST is for Florists, Seedsmen, and dealers in wares pertaining to those lines ONLY. Please to remember it.

Orders for less than one-half inch space not accepted.

Advertisements must reach us by Monday to secure insertion in the issue for the following Thursday.

Address THE AMERICAN FLORIST CO., Chicago.

FLORISTS' WINDOWS.

The appearance of a florist's window is likely to be taken by the public as an index of what he has to offer within. Cleanliness is the first consideration. Cobwebs and dust, dirty bottles filled with dirtier water, dead or dying plants, slimy flower pots, faded willow baskets with last year's dead flies scattered about—with such a window display as this (and they are not infrequent) how can florists expect nice customers to even cross their thresholds?

Fully as forbidding and repulsive to many customers are the profuse displays of the emblems of mourning which some dealers pack into their show windows, reminding one of an undertaking establishment and sending a chill up and down one's back bone.

A clean and attractive window display is one of the very best advertisements a florist can possibly have. It is not always the quantity of flowers displayed that tells, but the arrangement. At special seasons, such as Easter, a grand massing of plants and flowers of every hue will attract by its magnificence and dazzling brilliancy, but as a general rule it is well to avoid mixtures of color or overcrowding, and a single plant, if a perfect specimen or a single vase of one variety of flowers with appropriate surroundings, is often the most attractive decoration that can be made. If possible it is advisable to make a complete change every day. Do not put an ice chest in your window. If you use it for your general stock it is impossible to keep it always tidy; besides, customers do not take kindly to ice chests, which suggest to them the idea that flowers are not fresh. Another important point is the lighting of a window and the judicious use of mirrors is also a great help.

THE SECRETARY of the American Chrysanthemum Society has sent to chrysanthemum growers a printed blank upon which the recipients are requested to fill in the names of new chrysanthemums raised or disseminated this season and other information which it is desirable to be made a matter of record with the society. The system of registration of names is especially valuable as avoiding duplication. Any grower or disseminator of chrysanthemums who has not yet reported same to the secretary of this society should not fail to do so. It is just as much an advantage to the grower as to the society to have the record complete. And by this means to the raiser is secured the credit due him as the society will be in evidence to settle any subsequent disputes. The society can do a splendid work if properly supported and given the necessary information. The secretary is Mr. Edwin Lonsdale, Chestnut Hill, Philadelphia, Pa.

IN ARRANGING the details of the coming exhibition do not forget to provide a supply of cards of suitable size for labeling the plants on exhibition. We believe it would pay the management of an exhibition to have in attendance during the time the final arrangement of the plants is being completed a competent letterer of placards to prepare as needed cards giving the names of the plants exhibited, these of course to be placed on the plants. This will add so much to the educational value of the exhibition that it will pay every time to incur this slight additional expense. And the party who gives out the names should verify the spelling of any regarding the correctness of which he is in any doubt.

IN OUR ISSUE of September 3 we published an item from Newport, R. I., to the effect that "Klunder & Co., a firm of florists from New York, were in trouble," etc. The Klunder Co., of New York, who have also a branch at Newport, fear that the similarity of names may work to their injury, and in justice to them we desire to state that the Klunder Co. is entirely distinct from the Klunder *and* Co. referred to in our news item.

"POPULAR GARDENING" of Buffalo is reported to have sold out to the Rural Publishing Co., New York City.

SITUATIONS, WANTS, FOR SALE.

Advertisements under this head will be inserted at the rate of 10 cents a line (seven words) each insertion. Cash must accompany order. Plant advs. not admitted under this head.

SITUATION WANTED—By a young florist well acquainted in the business; good design worker. J. WOLF, 170 Broughton St., Savannah, Ga.

SITUATION WANTED—To put up steam or water heating apparatus in greenhouses. Or will work by contract. Thoroughly experienced. Address CHAS. EICHENBAUM, 742 N. Ashland Ave., Chicago.

SITUATION WANTED—By a young man with ten years' experience in the growing of palms, ferns, orchids, roses, and stove and greenhouse plants. Address B, Tuckahoe, N. Y., P. O. box 42.

SITUATION WANTED—By a practical seedsman of superior executive ability, with 25 years' actual experience, possessing facts and figures and a full knowledge in detail of wholesale, retail and catalogue trade; owner of a large mailing list of cash catalogue buyers, also a large and extended business acquaintance at home and abroad, controlling several stocks grown this season. Address SEEDSMAN, 57 Chestnut St., Rochester, N. Y.

WANTED—A young, competent florist for retail store; must have A 1 references. Address B R, care American Florist

DIRECTORY.
Every Florist, Nurseryman and Seedsman should have one.
AMERICAN FLORIST CO., Chicago.

The Seed Trade.

AM. SEED TRADE ASSOCIATION.

F. BARTELDES, Lawrence, Kan., president; A. L. DON, New York, secretary and treasurer. The tenth annual meeting at Hartford, Conn., second Tuesday in June, 1892. Applications for membership should be addressed to Wm. Meggatt, chairman membership committee, Wethersfield, Conn.

VICK'S MAGAZINE will be continued under charge of Mr. James Vick.

WE CALL ATTENTION to the advertisement of "Seedsman" in our "want column."

VISITED CHICAGO: J. Comont, of Carter, Dunnell & Beale, London; L. L. May, St. Paul.

D. M. FERRY & Co. are adding to their seed storage capacity a building eight stories high and 85x120 feet.

IT IS REPORTED that James and Charles Vick will continue the seed business under the name of James Vick's Sons or James Vick Sons Co.

THE Board of General Appraisers at New York have set for hearing December 4 all protests regarding duties assessed on plants, nursery stock and seeds, received prior to July 22.

Judging Fruits.

Dr. F. M. Hexamer wrought a revolution in the mode of awarding prizes at the N. Y. State Fair. Last year he suggested that fewer judges could probably make the fruit awards more quickly and satisfactorily. This year the authorities thrust upon the doctor himself that important and many-sided function, and made him the sole judge. He called all the exhibitors around him, announced a mathematical scale of merit for the several qualities, applied it in their presence to all the fruit exhibits and officially declared the awards.

DON'T YOU FORGET IT!

THE SNOWFLAKE DAISIES, treated as Violets, mean abundance of beautiful white flowers all winter; thousands of plants ready, 3-inch, in bud and bloom, $5 00 per 100; $40.00 per 1000. 2-inch, in bud and bloom, $3.00 per 100; $25.00 per 1000. Large clumps, from open ground, $4.00 per 100. Rooted cuttings $2.00 per 100.

F. O. B. on Rail, and extra plants to pay express.

Planting White Pine Trees.

Bids are invited for planting, in the spring of 1892, and at the proper season, of 4,000 White Pine Trees along the line of the Blue Mountain Forest Fence, about 1,500 on the west side of the mountain and 2,500 on the east side, at points to be named by me. No bid will be entertained for a less number than 500 from one party. All trees must be well formed, strong and healthy, not less than four feet high, and be thoroughly well planted. The bids must cover everything—delivery of trees and planting same.

Payment will be made as follows:

Fifty per cent. on completion and acceptance of work; 25 per cent. upon such as are alive and in good, sound condition September 1, 1892; 25 per cent. or so much of it as may be due, counting such as may be alive and in good condition June 1, 1893. The intention is that such trees as are furnished and planted are to be guaranteed to live until June, 1898, and any that are not alive at that time are not to be paid for. Address

Bedding Plants.

At Lincoln Park, Chicago, Head Gardener Stromback is now putting in the sand-bed cuttings from all soft-wooded bedding plants, vines, etc., taking the cuttings from the plants that have been bedded or in vases, etc., during the summer.

Cuttings of alternantheras were taken August 15. These were rooted some time since, and are already potted off, three cuttings in a 2-inch pot, where they will remain until March, when they will be separated and placed singly in pots of same size. By placing the three cuttings in one pot a large quantity can be carried over the winter in a small space, the separation and potting singly being done before much growth has been made in the spring.

The coleus were propagated about August 1 from trimmings from the beds in the park. These plants will serve as the stock from which the main crop will be propagated in spring.

The geranium cuttings from bedded plants are now nearly all in the sand bed, as are also those from all other soft wooded bedding plants.

Mr. Stromback carries over only a few old plants, and these are simply to supply tall plants for vases, boxes, etc. The stock propagated in the spring will be entirely from the plants now being struck in the sand beds.

Pansies Dying.

What is the cause of pansies dying about a week after coming up in the seed bed? I sowed the seed in a sandy loam, which is termed in California "settlement," mixed with about one sixth of rotten manure taken from a mushroom bed one year ago. The seed was fairly covered with soil and the beds shaded with heavy mats till after the seed germinated, when laths were substituted for the mats. About 60% of the plants died within 3 weeks after they came up. Lobelias, petunias, myosotis, bellis, dianthus, etc., are doing very well under the same treatment.

HERMAN SCHWARZ.

Sacramento, Cal.

[Pansy seed sown under too dense a shading will germinate quicker, but will produce weak plants that will invariably damp off in large proportion after a few heavy showers. I have found that lath shading, with the laths one inch apart, over the beds after sowing the seed, gives the best results. At this time of the year no shading is required. DENYS ZIRNGIEBEL.]

New Greenhouses.

Mr. George A. Heinl of this city has extended his borders considerably the past summer, having purchased a tract of land just beyond the city limits about 2 miles from his old stand on Cherry street and erected thereon a block of seven fine houses. His old place contains 16 fine houses, which together with the new range gives him a plant of some 34,000 feet of glass. In making this move, which was made necessary by the very rapid growth of his city trade, Mr. Heinl has laid the foundation for one of the finest establishments in the state, as his purpose is to add each year several houses and eventually remove the Cherry street establishment out there.

The houses are models in construction and combine strength and beauty in a remarkable degree, and Mr. Heinl has spared no expense to make them complete in every detail. As his trade is principally in cut flowers, the new houses will be devoted to carnations and violets, with one or two houses of roses, the Cherry street place being devoted to roses, chrysanthemums, smilax and one house of palms, ferns, etc. The new range of houses are built an 18-foot one and a 10 foot one alternately, and the arrangement of the benches is such that the large house does not shade the small one at all. They are all built on the three-quarter span principle. Posts, siding and benches are all of seasoned oak, sash bars and purlins of the finest cypress, the supports all 1¼ inch iron pipe, the glass a clear double thick 12x12, laid in putty with patent zinc joints. The doors are seasoned cypress, oiled, contrasting nicely with the beautiful white of the whole interior and adding very materially to the effect. The houses are also fitted with a ventilator lift, which is by far the best I have yet seen.

The benches are arranged on a new plan. Instead of a bench in the center 6 feet wide and two side benches each 3 feet wide, as in the regulation rose house, the houses being 18 feet in the clear, there are two benches, each 6 feet wide, separated by a 2-foot walk in the center, which gives also a 2-foot walk on each side next the wall, which is 5 feet high, the pitch of the roof being sufficient to afford headroom. In the 10-foot houses there is one bench 6 feet wide in the center, with a 2-foot walk all around. This arrangement of the benches possesses many advantages over the old style, as will readily be seen by any practical grower, and experience has proved to me that a house benched in this way will produce one-third more flowers, either carnations or roses, than one arranged on the old style.

The whole establishment will be heated by steam, the boiler being placed in a cellar at the west end 22 feet square and 12 feet deep, the lay of the land making a wet cellar an impossibility.

Water is supplied from an elevated tank and is obtained by windmill power from a driven well 165 feet deep. A large work-room extends along the northwest end of the range, 22x100 feet, altogether making this one of the most complete establishments.

It is Mr. Heinl's intention to devote considerable space to the growing of hardy shrubs, bulbs, etc., for cut-bloom, and also to create a small lake in which to grow aquatics, a certain portion of his land affording fine possibilities in that direction. EDWARD SALYER.

Toledo, O.

EXCELSIOR STANDARD FLOWER POTS,

With Patent Ventilated and Perfect Drainage Bottom.

CARD. We beg leave to call your attention to our EXCELSIOR STANDARD POTS. You cannot well afford to be without them, as they are especially adapted for growing Chrysanthemums and all valuable plants.

AHEAD OF EVERYTHING.

We Follow None, Prize or No Prize.

Our latest improvements in machinery produce a Standard Pot which for lightness, smoothness and durability, has never been equaled. Customers buying of us will

SAVE ONE-THIRD IN FREIGHT.

And to prove this, we give below a table showing number in Crate and WEIGHT of same, which speaks for itself:

Size.	No. in Crate.	Weight.
1¾-inch	3,000	250 lbs.
2 "	2,400	250 "
2¼ "	1,750	250 "
2½ "	1,450	250 "
3 "	1,280	350 "
3½ "	800	350 "
4 "	600	350 "

It will be seen at a glance, that our pots are one-third lighter than formerly, and yet we claim that owing to the superior quality of our clay and improved machinery, they are stronger than any pot in the market, and we frankly ask you to make the test. ☞ SEND FOR PRICES.

OFFICE OF
W. W. GREENE & SON,
FLORISTS.

Watertown, N. Y., Sept. 21, *1891.*

HEREDEEN MF'G CO., Geneva, N. Y.,

GENTLEMEN:—The new Greenhouse edition of your Boiler Catalogue is received, and we are glad to note your continued and deserved prosperity. We still continue to sing the praises of your "Faultless Furman" Boilers.

We recently were very much pleased, as well as sorry, for one of our brother florists, who lives in _____, a few miles from us. Sorry to hear that he has had bad luck with his boiler, and pleased because we did not buy a tubular boiler, as he did.

Before he bought, we talked to him, and supposed we had him ***solid*** for a Furman; the next thing we knew, he had bought a wrought iron boiler, "way ahead of yours."

That was less than two years ago. This Summer he has had to replace all the tubes, at a cost of $120. That is the beauty of wrought iron boilers. They require too much care, and are too expensive to run, for ordinary florists to own.

Our Furman Boilers have been run now four years, and have not cost us a dollar for repairs. Very truly,

W. W. GREENE & SON.

IF YOU have not already so decided, make up you mind now to keep a record of blooms cut from each of the plants you grow for cut flowers, especially your roses and carnations. Of course it will be some trouble, but it is worth some trouble to know whether what you are growing pays you well, only fair or is making you a loss.

The Possibilities of the Floricultural Display at the World's Fair.

BY JOHN THORPE.

[Read before the Horticultural Society of Chicago October 7.]

Realizing the importance of the World's Columbian Exposition, and the influence it will have on industries of all kinds, I feel assured that floriculture will be benefited even more than the most sanguine can expect. It has been my pleasure to watch over, and in a measure care for, American floriculture for nearly twenty years, and when I look back and realize what has been done, a part of it seems even more enchanting than the Arabian Nights. I well remember the poorly-grown plants, improperly named, the limited knowledge of their cultivation, the almost general irresponsibility of many thus engaged, the very few species obtainable, and the general careless way in which plants were packed and shipped. But with the steady march of progress and notably by the aid of the Society of American Florists and 965 state and local societies and florists' clubs during the past six years, by the aid of the press, professional and secular, by the aid of exhibitions, and by the education which has naturally been obtained from the sources mentioned, the advance of floriculture is one of the wonders of the time.

From a commercial standpoint the last United States census report of commercial floriculture in a digest is as follows:

"In the United States there were 4,659 floral establishments in the census year, 312 of which were owned and conducted by women. The total feet of glass in use in all these establishments was 38,823,247, and the establishments, including fixtures and heating apparatus, were valued at $38,355,722.43. The value of tools and implements used was $1,587,693.93. There were employed 16,847 men and 1,958 women, the combined annual wages amounting to $8,483,657. Fuel cost was $1,160,152.66; 3,245,600 wholesale, and 17,630,094 retail catalogues are annually issued, while $767,438.21 was paid for postage, $1,161,168.31 for advertising, $354,221.86 for freight, and $554,390.55 for express bills. The total products were 49,056,253 roses, 38,380,872 hardy plants and shrubs, and 152,835,292 of all other plants, the value of which was $12,036,477.76, and cut flowers to the amount of $14,175,328.01 were reported as sold."

This brings me now to the possibilities of floriculture at the World's Columbian Exposition, as it should be. The loftiest ideas and the very highest aims only are compatible with the advancement of the profession. Small exhibits cannot be expected to be effective. Groups of plants of all kinds will not be shown simply in hundreds, but in thousands and tens of thousands.

The general massing of the plants will be on such a scale as to astonish even those who are acquainted with what has been accomplished. As a matter of fact, and one that is conceded by those best able to judge, the parks of Chicago have at this moment the finest displays of floricultural adornments of all the cities in the world. The brilliant and effective coloring to be seen in the designs at Washington Park, and the superb water lily displays at Lincoln Park, together with the fine displays at the other parks, have gladdened the hearts and called forth the admiration of hundreds of thousands. Remembering what Chicago has and is now doing for floriculture in her parks, the Floricultural Department of the World's Fair must outstrip all previous attempts in all and every one of its branches, even to surpassing the magnificent work here mentioned. This can only be obtained by a determination to eclipse all previous efforts; not one moment must be given to looking backward. There is no time to look backward.

In that magnificent building, Horticultural Hall, will be found space enough to make displays of nearly all exhibits requiring protection. The building is 1,000 feet long, with an extreme width of 286 feet. The plan is a central pavilion, with two end pavilions, each connected to the outer pavilion by front and rear curtains, forming two interior courts, each 88x270 feet. These courts are to be beautifully decorated in color, and planted with ornamental shrubs and flowers. The center pavilion is roofed by a crystal dome 187 feet in diameter and 113 feet high, under which will be exhibited the tallest palms, bamboos and tree ferns that can be procured. There is a gallery in each of the pavilions. The galleries of the end pavilions are designed for cafes, the situation and the surroundings being particularly well adapted to recreation and refreshment. The cafes are surrounded by an arcade on three sides, from which charming views of the grounds can be obtained.

Of various tropical plants there will be large groups of orchids, palms, ferns and in fact nearly every known decorative species and variety.

Outdoor floriculture will be on such a scale of magnificence as to eclipse all previous efforts, beginning with the showy tulips and hyacinths, ending with chrysanthemums and cosmos. Floriculture must be representative in every sense of the word. However much the cut flowers of roses, carnations, and chrysanthemums are admired, and, though large numbers of them are produced, they but very imperfectly represent floriculture. Plants of all kinds must be grown and cared for. We should not only have a large variety of plants and flowers for the decoration of dwellings and the adornment of greenhouses, but every plant suitable for the

decoration of lawns and gardens. For example, all bulbous plants, all herbaceous plants, and the many beautiful annuals and biennials such as are cheaply obtained and easily grown, must have all the encouragement possible at the World's Columbian Exposition. Let us do everything on a scale equal to the magnitude of the undertaking.

I venture to suggest to your society (and not only to it, but to all state societies, all other horticultural societies, and to all florists' clubs), a plan to raise funds for special purposes to create and maintain meritorious displays from different localities. State societies could, through assemblymen, ask for a special appropriation of a good round sum from their legislators. Horticultural and florists' clubs could collect subscriptions from those interested in floriculture. I suggest that a certain portion of the funds thus obtained be set aside for the collecting, transporting and maintenance of such exhibits which may be collected for the World's Fair, the greater proportion, however, to be distributed in gold and silver medals, or such other premiums as may be decided upon.

In conclusion, I predict that the World's Columbian Exposition will advance floriculture 25 years.

The Arrangement of Plants in Large Conservatories.

Florists grow their plants in pots for convenience in handling and shipping them, for it is necessary that they shall always have them, roots and tops, under complete control. And in the case of unusually large specimens, say of palms or tree ferns, boxes or tubs may be used for the roots, but the object in every case is the same. With the florist it is not how to get the prettiest and most luxuriant growth in the plants they grow as how to get them up and present them in the most salable condition, and keep them in good health in this state till they are sold. With the nurseryman it is much the same; he wants young, vigorous stock, and with root pruning, top pruning or transplanting tries to keep his plants for years in a young-like condition, when if allowed unrestricted growth they would have become too large to be profitable to him to handle or carry as merchandise any longer.

In spacious private or public conservatories, however, we want luxuriant growth, handsome forms, and a natural tasteful arrangement of the plants, and in order to obtain this instead of retaining them in pots we plant them out in beds within the conservatories just as we would in a sub-tropical garden in the open air. The beds are of irregular form, and the paths winding, like an out-door landscape, and there is nothing of the formality of the potted plant greenhouse.

Although a few large palms and tree ferns would fill up considerable of a house so far as the spread of their foliage is concerned, they must not restrict us in the way of variety. Hosts of our loveliest foliage plants as ferns, mosses, marantas, green-leaved draciænas, philodendrons, begonias, and the like luxuriate in such shady places and the stems of the palms and ferns can be draped or clad with tropical creeping plants and studded with orchids or bromeliads.

Bamboos love such a home, and according to kind and strength will rise ten or fifty feet in mass in a single season, and Rhapis flabelliformis will thrive in the densest shade. Where open or light spaces occur near the paths, anthuriums, crotons, draciænas, or other high-colored leaved plants may be ranged, and fittonias, tradescantias, cyrtoderias and the like run riot among the ferns on the ground.

Any portion of wall may be lined with moss held in place by wire netting or other means, and planted with begonias, ferns, and other plants, and we can have a little waterfall and pool in some part, the wetted rocks affording a happy home for filmy ferns, and the pool for brilliant-hued fishes.

Bananas, bread-fruit, dates, guavas and other tropical fruits can here find a home, adding interest to variety. And allamandas, stephanotis, bignonias and other handsome vines furnish drapery and beauty. Orchids as they come into bloom in the other greenhouses may be suspended from the plants or roof for gay effect and variety, and for the same end other potted plants may also be temporarily introduced, burying the pots out of sight or covering them up while they are in here, so as not to mar the natural effect of the arrangement.

In the lesser conservatories of this style a bench for potted plants is often erected along the sides of the building and where all manner of fine-leaved hothouse plants requiring warmth, moisture, and shade find as congenial a home as in a regular bench greenhouse.

As the natural style is the most pleasurable of all arrangements for large conservatories, florists should urge its adoption in public and private gardens, for we all know the better satisfied the people are with the plants they grow the more apt they are to add to the gratification of their taste in this direction, and their neighbors and other acquaintances to emulate them.

Our full-page illustration presents a view in the main conservatory of the parks of Allegheny City, Pa., showing the natural style of arrangement as there adopted. The picture is certainly a beautiful one, and Supt. Hamilton is justly proud of the result of his labors.

Our Telephone.

"Hello!"

"Is that Mr. Robert Craig, of Philadelphia?"

"Yes."

"Mr. Craig, have you anything to say which you think will interest the readers of the FLORIST this morning?"

"Well, you might tell them that the coming chrysanthemum show here will be strong in seedlings of merit. We are all into it this year, and there are sure to be some grand ones."

"Do you still consider the 'Widener' the best yellow on the market?"

"Yes, decidedly. We have a whole house of it that promises well, but we have also a house of 'Lincoln' which I regard as the next best yellow in cultivation. It comes in about a week earlier than the 'Widener,' and is consequently indispensable.

"We are just potting off a batch of that useful little white chrysanthemum 'Ivory.' Its habit is perfect, being shapely and symmetrical, as well as very dwarf, and it is unexcelled as a pot plant."

"How about ferns? Anything new?"

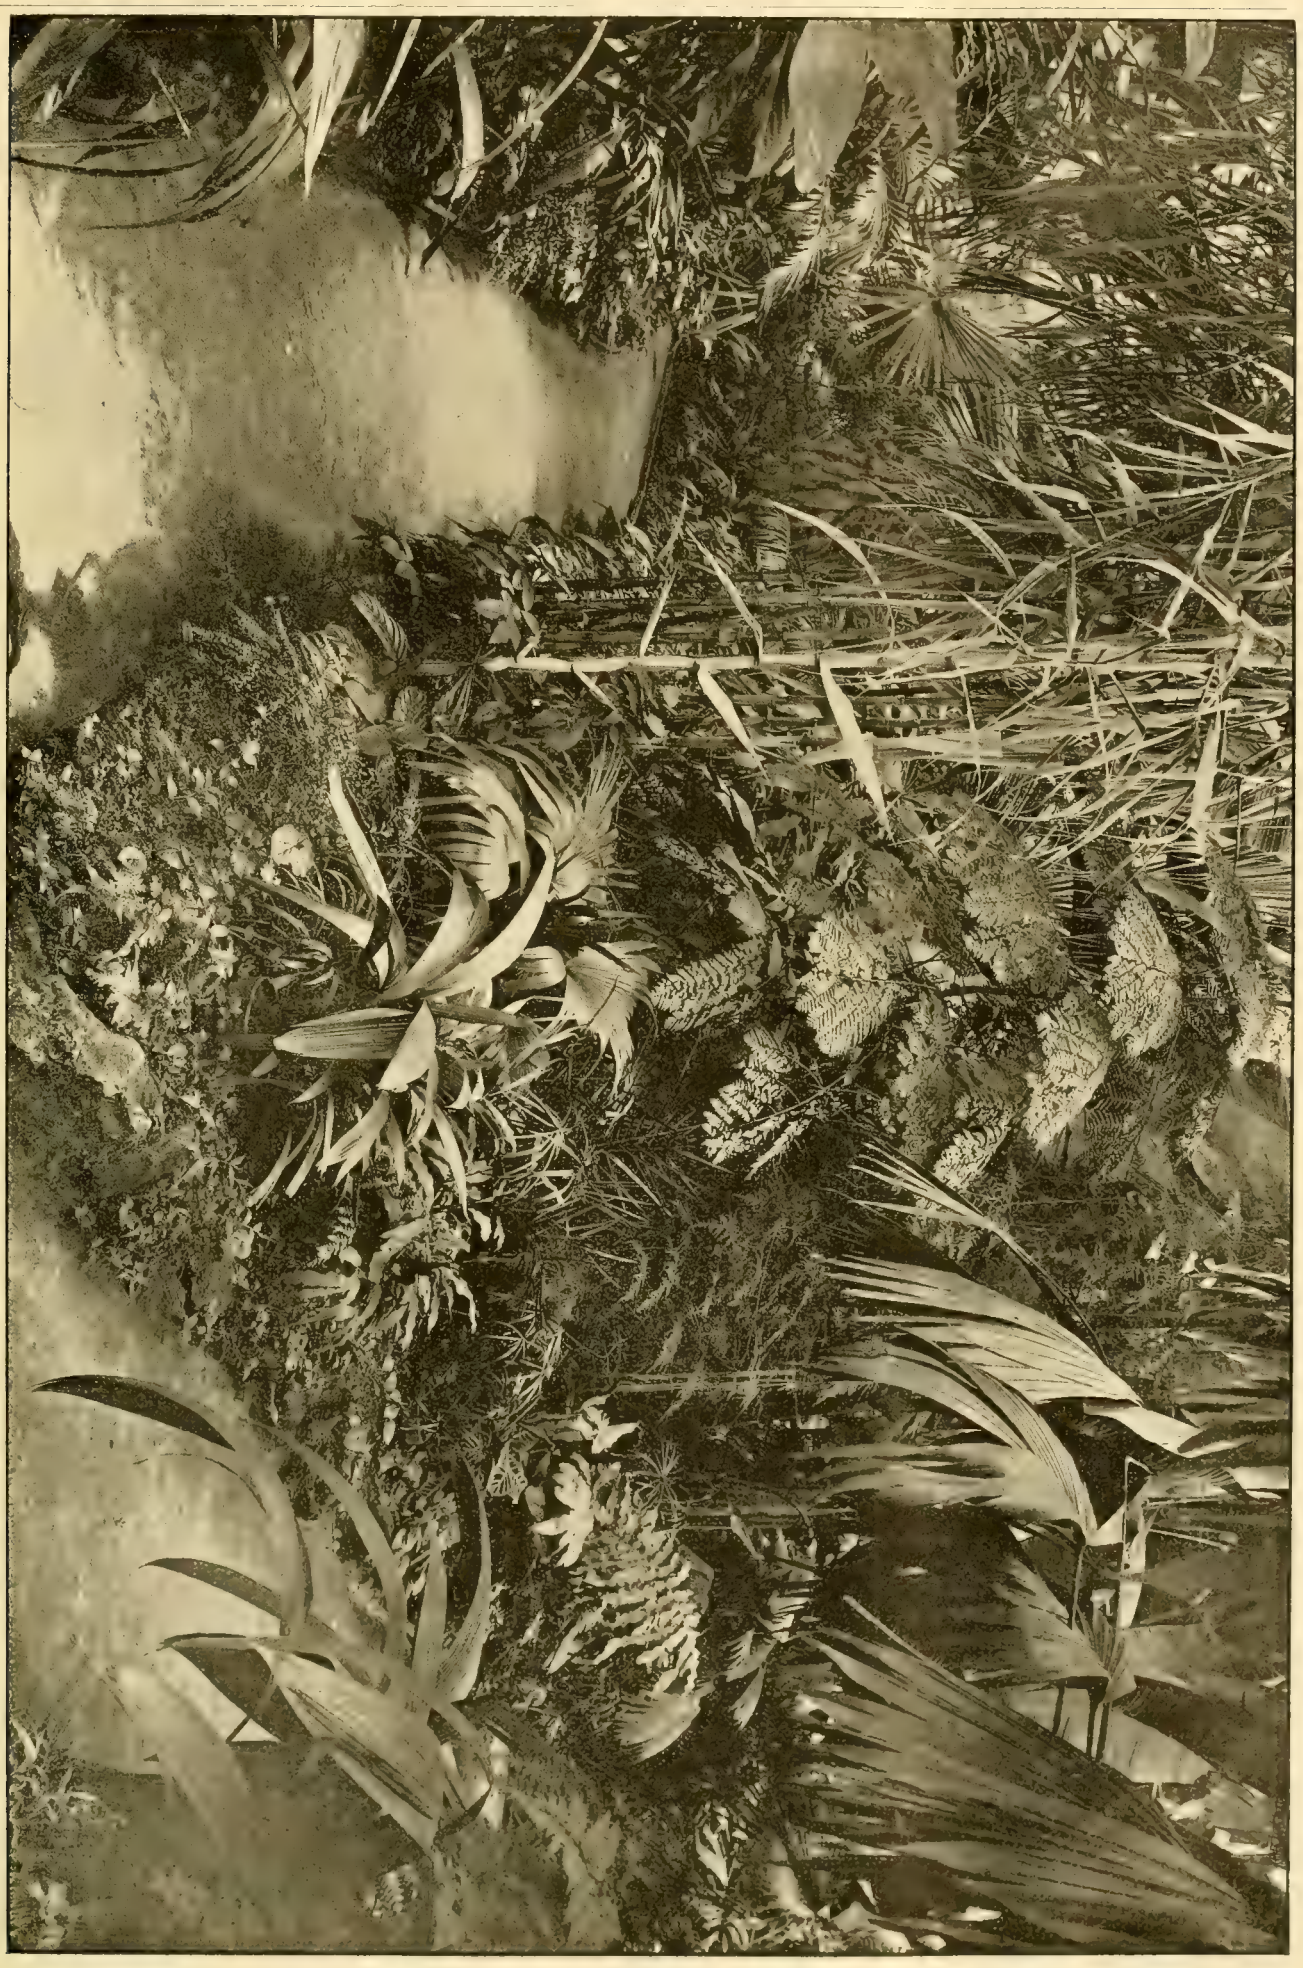
"Yes, we have some recent arrivals. Adiantum Versaillensis is one of these. It is a compact, crested form, good color, with a purplish cast, and will be much sought for amateur collections, although perhaps not specially valuable for the trade.

"Pteris serrulata cristata Dicksonii is handsomer than the old cristata, being more dwarf and of finer form, and will be valuable as a basket fern.

"Adiantum Mayii is a new one that originated with us. It appears to be a cross between cuneatum and decorum, having the characteristics of both of these, but that is not certain, as it is a chance seedling; a 'love child,' I call it, and naturally it is a good one; but you'd better not say anything about that.

"Nephrolepis davallioides furcans is beginning to be recognized as a table decorative plant. It stands unusually well.

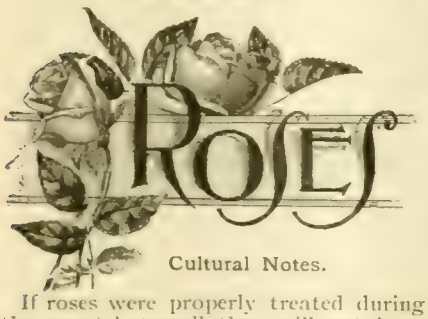
"Another good table fern is Nephrolepis Zollingeriana. It is very graceful, is a rapid grower, and can be done cheap. Florists generally don't know its value yet.



"By the way, we have adopted a new method of palm growing. We find that planted out on the benches from thumb-pots they grow as fast again as when kept constantly in pots. We got the idea from Belgium, where some of the largest growers are doing it entirely this way. We all know the difference in growth of roses or chrysanthemums when planted out as compared with those grown in pots, and I find that with kentias and other palms the difference is fully as great. When the plants are large enough we put them in 5-inch pots, and they do not suffer in the least from the lifting.

"Our Philadelphia palm growers are coming to the conclusion that we cannot in the future profitably import palms from Europe. The plants they send over here are badly drawn up. They should be given more room from their earliest stages until sold. Dealers over there seem to think that anything is good enough for us, but their stuff is not well enough grown for the American trade. We have all had enough of it, and we are about done importing. The same story applies to araucarias. We have a lot of Araucaria excelsa that were recently imported. They are all seedlings, and consequently imperfect and irregular at the bottom. Over there they could not sell such plants, but they expect us to be satisfied with them. We shall soon grow our own. This will open up a new field, and American florists will soon find that home grown plants will do better every time than imported ones. If some enterprising seedsmen will undertake to supply us with first-class fresh palm and araucaria seed we will support them heartily, and they will find a good demand. Foreign houses which are now loading up with palms for the American trade will certainly be disappointed. It should be generally known that araucaria seed to be good should be imported only in cones. They come from Australia and the adjacent islands, and if shelled out they dry up too much and will not germinate."

"What has been your experience with summer-blooming roses this year, Mr. Craig?"



"Well, we regard Marie Guillot as decidedly the best out-door rose. As a pot plant it is also unequaled. It is a most profuse bloomer. Our neighbor, Jacob Becker, makes a profitable thing out of it every summer. We find that the 'Gontier' is the best out-door red tea rose that we have to-day. It is a splendid bedder. Plant it out in a mass with a border of 'Clotilde Soupert' round it, and you have a fine combination.

"We are making quite a success with seedling cyclamens, and find them far superior to plants grown from imported bulbs. From seed sown one year ago this month we have plants now, some of which are a foot across. This year we

VIEW IN THE CONSERVATORY OF THE PUBLIC PARK AT ALLEGHENY CITY, PA.

sowed our seed earlier, and look for still better results next year. We keep them through winter in small pots until May, when we shift them into 4-inch pots, and set them in frames outside. By July they are ready to go into 6-inch pots. The trying thing is to get them through the hot weather. This we accomplish by covering the raised sashes with muslin, thus securing a good circulation of cool air. Another essential is to keep them clean. Green-fly will soon curl the leaves unless watched. We lay tobacco stems between the rows, changing them every three weeks."

Cultural Notes.

If roses were properly treated during the recent hot spell they will not have suffered to any great extent from the heat except that the crop of buds that may have been on them were hurried open.

By proper treatment I mean lots of air during the day, a little through the night and not too much water. Fortunately it has been so we could regulate the growth by ventilation and controlling the moisture, whereas had it been wet as well as hot we would have had a rapid and soft growth on the plants, which is I think very undesirable at this time of the year with some varieties like Watteville and Cusin, causing a blind growth and resulting in but few flowers for a good part of the winter. I well remember having a house of these two kinds a few years since that were kept too wet during late August and September. The weather being favorable they made a beautiful growth. What a fine house of roses I had to show any visitors who called around just then! I always took them in that house last, so they might go away with a good impression of the place. The luxuriant appearance of the plants was very much admired by several people, but one or two (whom I presume had been through a similar experience) said: "It is a fine growth, but a little soft." The result of this soft growth was very few and poor flowers until the days began to lengthen in February and the plants left in suitable condition for mildew, etc.

Do not by any means allow tea roses to go to rest or dry them off at this season; that would be equally as bad as the soft growth; but by limiting the supply of water and giving plenty of air try for good tough wood.

I favor a little ventilation at night until firing is commenced, for though the house gets a few degrees cooler, it is better than a close, stagnant atmosphere, and plants that are well hardened will not easily suffer by a temperature of 50° at night. Don't wait too long before you begin to fire, and of course then ventilate as the case may require. Should your house keep cool enough with one steam pipe or a very slow hot water circulation, there is no special necessity to open the sash, for as soon as you apply heat there is more or less ventilation through the cracks at the laps of the glass or other openings to be found in any greenhouse, though a little more fire with slightly opened ventilators would be still better for a time. Should the weather be wet or foggy don't attempt to keep the desired temperature with closed sash and small fires, but put on plenty of air and then fire to keep thermometer at point wanted.

Of course all watering and syringing must be done early in the day and if the weather is clear don't be afraid to use the syringe, for red spider increases rapidly when the surroundings are favorable and the hot pipes will help them, so take every opportunity to get rid of what you have. See that your men know what they are using the hose for and that it is necessary for every leaf to have a good wetting on the underside. Should there be a board walk through the center of large middle bed for convenience in tying, cutting buds, etc., let them go along that with the syringe once in a while, for many a fine house of roses has been injured with spider starting alongside that very board. All men are human and greenhouse men like others are apt to do their work in the easiest way for themselves and this board walk is not a convenient place to syringe from, especially if they must get under the bottom leaves of the plants.

Make short work of any green fly that appears, even if you have to fumigate to do it and spoil a few buds by doing so, but get rid of the fly some way. It is best if possible to avoid burning tobacco in the rose houses, as it is almost sure to damage the flowers to some extent; scattering the stems around the walks and underneath the benches is the best plan I have found, but it is expensive where tobacco is scarce.

A few years ago I had two or three hose taps put into the steam pipes in some of the houses, then filled a barrel with stems and screwed the hose on to pipe and into the bottom of the barrel, then turned on the steam, thus causing a jet of steam to force its way through the barrel of stems, causing a very pungent vapor that was death to the green fly. It is necessary to move the barrel along the house as the vapor seems to fill only the part near it in a reasonable time. This plan is destructive to the common hose, but might be worth trying where tobacco is expensive and steam is used.

This is the great mildew season, so use sulphur whenever it appears, but not in heavy doses, as I believe it is injurious to the roots if washed down to them in large quantities. It is not necessary to put it on heavy, but have it well distributed over the parts affected. Closing up the house for a short time after using it if the day is clear will make it much more effective, but be careful not to let it get too hot (say over 90°) or the plants will be damaged. Mildew will give very little trouble after you are firing regularly and then of course the sulphur is applied to the pipes.

Roses in most places will now be tied up to wire or stakes. Where it is not done it should be commenced at once and by all means avoid having them tied with a string around the whole plant, crowding up a number of the lower leaves into a tight bunch in the center. If the plants are very bushy put in two stakes and fasten them up first the long, strong shoots. The short stuff at the bottom is better left untied than to be bunched up like a wheat sheaf.

The fall top dressing should now be given. Before putting it on have all dead leaves, etc., picked from the plants and beds. If the manure is at all fresh or hot it should be turned over two or three times before using. By doing this you will of course lose a little of the ammonia, but that is better than to burn the roses. After putting on the manure if you are at all afraid of burning take some fine screened dry soil and spread thinly over the top of it. A very little will absorb what ammonia is likely to escape from a mulching 1½ inches thick. If possible always ventilate night and day for a few days after putting on fresh manure.

A dressing of bone dust on the soil before putting on the top dressing will be beneficial if you think the soil is not very good. Bone unless very fine is slow in its action, so the plants will not get the benefit of it as quickly as they will from the manure, the value of which goes down to them in the form of liquid, but the roots will come up to the top of the soil after a while and then get tangled up with the small pieces of bone much to their benefit.

Be careful not to use bone with acid in it. The safest I have found is button bone. It is the chips and waste from the lathe when turning buttons and other bone articles and so has had nothing applied to soften it and make it easily ground; it is rather coarse, but when the roots set among it the plants are none the worse for it. JOHN BURTON.

Chestnut Hill, Pa.

[The above was intended for last week's issue, but was received a little too late for that number.—ED.]

Rose Reminders.

The tying of roses is one of the important details to be attended to at this season of the year. Very often the plants are tied too close, that is to say they are not left sufficiently loose or open to admit of sun and air freely among the leaves and branches. When we consider that the leaves are the lungs of the plants it is of great importance that sufficient breathing space should be allowed.

Many establishments are now using wire almost exclusively. The latest is a steel rod instead of the commoner cane or other wooden stake. They of course have to be secured at the top to wires running horizontally the length of the house in the same manner that thin stakes have been used formerly and are still used in some places. The first expense of the steel rods will cause some to hesitate about using them, but they will certainly prove to be the cheapest in the end. If they are galvanized, so much the better. Indeed it seems to me that they ought to be galvanized, both for the sake of appearance and the handling.

If not already done, a light top dressing of well rotted cow manure should be given without further delay, as it is better to do it now when a crack of air may be left on all night. A little and often is better than the old style of giving a mulching of six or eight inches of fresh and pasty cow manure.

Care must be taken when heat is left on all night that the temperature is not allowed to get too high. Artificial heat and some air is much better for the well being of the plants than no heat and a tightly closed house.

Much good judgment must be exercised in the management of the crops of buds. Chrysanthemums will soon be with us, when it is not wise to have too many roses. In disbudding leave only the very strongest of the shoots to flower, then take off all the buds but one.

Among new roses Mme. Pierre Guillot is attracting a great deal of attention. Mr. J. N. May thinks so well of it that he has one of his large houses planted with it. It belongs to the same class as Mme. de Watteville, but it is a much more refined flower, and Mr. May declares that

it is not so liable to burn in the spring as the older variety.

Ma Capucine is coming to the front again. It is the daintiest little rose in cultivation and if I am not very much mistaken will become more popular as time goes on. It is much smaller than Bon Silene and it has no more petals, but the color is exquisite. The time is approaching when this will be taken and Paul Neyron and its compeers left, excepting possibly in the spring months, when its frailty will render it less valuable than in the cooler weather of winter.

For early forcing it is time hybrids were pruned. These require very careful watering for some time after being started. Many plants are killed outright and others weakened through carelessness at this critical period of their existence, so much so that the item of watering alone will either make or mar the crop, which will always make the forcing of this class of roses to a successful issue, an uncertain undertaking. E. L.

The season has now arrived when great care should be exercised in keeping the atmosphere in the houses in a healthy condition, particularly during mild nights when it may appear from general indications that the outside temperature is not cold enough to require fire heat, for herein lies the danger of implanting disease, such as black spot, mildew and many other kindred troubles. A temperature of 56° at night without fire heat for several nights in succession, particularly if a heavy dew is seen on the plants in early morning, means wholesale destruction of many fine plants and blighted hopes of crops of fine flowers. To avoid such a calamity I would advise keeping a very little fire heat circulating through the houses at all times after it is necessary to once start it, and on mild nights have a little air on to keep down the temperature, the main object being to keep a healthy atmosphere during the night to prevent any heavy dews collecting on the young foliage. I have seen several cases where the young foliage would after three or four nights of such conditions show slight indications of flagging in the bright sun and in twenty-four to forty-eight hours after the entire surface under them would be covered with the leaves and all the young wood would turn first a spotted brown, then black clear back to the old hard wood; this means the destruction of the entire crop for two or three months, and what is still worse, the very sudden check to the tops means an equal check to the root action, and in some cases I have known it to completely kill the plants.

When anyone is so unfortunate as to get caught in such a way the only remedy is to cut the shoots affected clear back to healthy wood; keep the soil at the roots as dry as reasonable without injuring the remaining part of the plant and keep plenty of air on the house during all mild days and nights too till the plants show indications of making new growths, then gradually increase the amount of water, but be very careful not to overwater the soil at any time till the root action is fully active again. Where healthy young stock is still on hand it often pays to replant if the stock is badly affected. Black spot, so common among some of the hybrid teas, is simply a modified form of the above, bearing the same relation to it as an ordinary sore throat does to a severe case of diptheria, and the causes producing them bear a very strong resemblance; and if we would only give the matter a few minutes' careful thought we would quickly see that to have our plants during warm days at this time of year often subjected to a temperature of 80° or more with an abundance of air circulating through them and then allow them within a few hours to stand in a cool, stagnated, moist atmosphere of 25° to 35° less, cannot but work to their injury. With an abundance of air circulating through them such a rapid change may not do any harm, as these conditions often occur in the open air during September and October and often the finest roses of the season are produced under just such circumstances. Now this very fact is frequently the cause of such trouble as above described, because the grower does not stop to consider the difference in the conditions between roses grown under glass and those in the open air, where nature provides a free circulation of air among the plants day and night alike.

JOHN N. MAY.

Staking Roses.

Have read Mr. Salyer's notes on staking roses, but differ with him in his opinion that cane stakes are the neatest in appearance of anything yet used. I would advise him to use wire and do away with stakes altogether. I will describe the method used here.

The top wires are fastened to the rafters with screw-eyes and the lower ones to the benches, either lengthwise or across; the latter I think best, being more convenient in cleaning between the plants. Then smaller wires are fastened to the larger ones at top and bottom, at the back of the plants. These cast much less shade than any stake, there is no rotting off and no hollow canes for insects to hide in. This plan originated here four years ago, and has since been used by other growers. JOHN SMITH.

Bayside, L. I.

A number of the eastern rose growers have been using for several years thin galvanized wire to tie their roses to. This is arranged by fastening a heavier wire over the rows of plants the length of the house, 4 or 5 feet above the soil, and in some cases directly under the rafters; other wires are put along or across the bed just above the soil; from one to the other of these wires, at each plant is fastened perpendicularly a thin wire to which the plant is tied.

The advantages of this plan are: The wire does not rot, is held firmly in place, is so thin it makes no shade and does not look heavy or clumsy when plants are small. But I have found it a great trouble in the summer. When taking out old plants it has to be removed entirely from the bed and hung to roof to be out of the way when cleaning and filling the tables. It is also difficult to put back again unless taken all to pieces, and this will result very shortly in breaking off the wire that has been twisted at the ends of upright pieces, making them too short to use again in same place.

A better plan, I think, is that described by Mr. Salyer in FLORIST of Sept. 24, page 146, but in place of cane stakes I use No. 6 steel wire rods. These are plenty stiff enough in 5 foot lengths and that is quite as long as roses generally need. The rod can be got from any wire manufacturer, they cutting it to any desired length. It would be best to have it galvanized, and I suppose it could be had in that shape without much additional cost. Those I used we painted, a man doing 2,000 of them in half a day by using a broad brush, laying a handful of them on a board and rolling them over as he used the brush. They will need two coats of paints to make them white, but one will keep them from rusting and lighten them up some. The cost of these rods is a trifle over $10 per 1000, 5 feet long. This I think is reasonable considering the time they will last.

I first saw this plan used at Messrs. P. Henderson & Co.'s and was much pleased with the neat, strong job it made and the ease with which it could be applied.

JOHN BURTON.

Seasonable Hints.

Now as the nights get longer and cooler many of the varieties will be showing color. Of course, those plants that are being grown for exhibition purposes must have careful watching, so as to attend to their needs at any moment.

When damp weather sets in, look out for any signs of fungus on the flowers. A little fire heat will be of benefit when the temperature gets low, and I advise keeping a chink of air on all night, so as to maintain a buoyant atmosphere. It is astonishing how chrysanthemum flowers grow under such conditions; the flower stalks thicken, the petals expand more, and the plant generally improves with the treatment mentioned.

Plants in pots for sale or for ordinary decorative work should also have the best of attention. I regret to say that there are still some growers of chrysanthemums who subject their plants to bad treatment. They think chrysanthemums will give them good flowers if they are put under the benches, on the pathways in dark houses, or crowded away in obscure corners; and this after months of work has been expended in caring for them. It's all wrong and should not be done. Those plants from which cut flowers are expected must have careful attention and the best of manipulation to obtain the best results. JOHN THORPE.

Classification of Chrysanthemums.

The classification of chrysanthemums having been placed in my hands by the National Chrysanthemum Society, I have associated with me Mr. A. H. Fewkes, and we would respectfully request the co-operation of, and solicit correspondence with, all chrysanthemum growers and anyone interested in the subject.

It is the intention of the committee to have all the information embodied in the report as authentic as possible. Any communications addressed to Mr. A. H. Fewkes, Newton Highlands, Mass., or myself will be thankfully received and promptly attended to.

ELIJAH A. WOOD.

West Newton, Mass.

SECRETARY RAGAN of the Indiana State Horticultural Society, in a communication to the Indianapolis *News*, says that as far as he is able to ascertain that society was the first of its kind and character organized west of Philadelphia. The society was organized August 22, 1840.

Cannas.

Cannas are now in their full glory and when you get several acres together they are a wonderful sight. I have taken great pains to compile the following classification from the fields before me. There are many good sorts outside this list, but those mentioned are very marked in merit under the different classes. The height is taken from plants grown under ordinary field culture. Planted and tended with plenty of manure and water, they will grow somewhat higher.

CLASSIFIED LIST OF CANNAS:

1.
Largest Flowers and freest blooming sorts.
Petite Jeanne
Souv. de M. Liabaud
Ulrich Brunner
Anton n Crozy
Jos Metral
Victor Hugo
Admiral Courbet
Isaac Casati
Edouard Andre
Jules Chretien
Francisque Morel
Star of 1891
Mme Crozy

2.
Yellow Flowers.
Admiral Courbet
Guillaume Coustou
Epis d'Or, 5 feet
Gladioliflora
Souvenir de Ceres
Premices de Nice

3.
Scarlet Flowers.
Ulrich Brunner
Edouard Andre
Victor Hugo
Safrano
Chevalier Besson
Revol-Massot
Francisque Morel
Commandant Riviere
Noutoni
Adolph Weick

4.
Flowers Yellow, Spotted Crimson.
Childsii
Mme Antoinette Allamagny
Mme de Sevigne
Louise Chretien
Mme Sabatier
Nana Grandiflora
Tonkin
Guillaume Coustou
Gen Boulanger, 4 ft
Emile Leclerc

5.
Crimson Colors.
Jules Chretien
Souv. de M. Liabaud
Murillo
Antonin Crozy

6.
Red Flowers.
Cardinalis, 3 ft
Henri Martin

7.
Scarlet and Crimson Flowers, With Yellow Border.
Star of 1891
Mme Crozy
Petite Jeanne

8.
Amber and Terra Cotta Shades.
M. Coulouvrat
Jacquemet-Bonnefond
Simone

9.
Dark Foliage
Safrano, 5 ft
Flamboyant, 4 ft
Ornament de Grand Rouge [Extra fine, very effective, 7 ft]
Robusta, 7 ft
Robusta Perfecta, 8 ft
Nigricans, 4 ft
*Zebrina, 4 ft
*Rendatleri, 4 ft
*Metalica, 5 ft
*Van Houtte, 4 ft
*Victor Hugo, 4 ft
*Isaac Casati, 3 ft
*Discolor
[This variety has the finest musa-like foliage of any. Set at right angles, the effect is very imposing, 8 ft]
*Barilleti, 5 ft
Gen de Negrier, 2 ft
[*The foliage of varieties marked thus (*) is not very dark, but ribbed and dark shaded.]

10.
Best Green Foliage.
Ehmanni, 6 ft
B. Cousancat, 8 ft
[The latest of the large and free-flowered kinds. Flowers large, scarlet]
Tonkin, 1 to 1½ ft
Albiflora, 1 to 1½ ft
Brenningsii, 1 to 1½ ft
[Foliage marked with white]
Simone, 1½ to 2 ft
Mme de Sevigne, 2 ft
Louis Thibaud, 2 ft
Antoine Chantin
Jules Chretien
Cardinalis, 3 ft
Glauca Vera, 5 ft
Selowii, 5 ft
Francisque Morel, 2 ft

11.
Tall Varieties.
Safrano, 5 ft
Epis d'Or, 5 ft
Antonin Crozy, 4 ft
B Cousancat, 8 ft
Discolor, 8 ft
Robusta, 7 ft
Robusta perfecta, 8 ft
Ornament de Grand Rouge, 7 ft
Metalica, 5 ft
Ehmanni, 6 ft

12.
Very Dwarf Varieties.
Tonkin, 1 to 1½ ft
Albiflora, 1½ ft
Brenningsii, 1½ ft
Mme de Sevigne, 2 ft
Simone, 2 ft
Souv. de M Liabaud, 2 ft
Chevalier Besson, 2 ft
Star of 1891, 2 ft
Mme Crozy, 3 ft
Petite Jeanne, 3 ft
Murillo
Ulrich Brunner
M. Scubeyrand 1½ ft
Gen de Negrier, 2 ft

13.
Foliage for Contrast.
Ornament de Grand Rouge
Discolor
Brenningsii [marbled white]
Flamboyant
Robusta
Safrano
Ehmanni
B. Cousancat

OCCASIONAL.

Notes on Garden Vines.

BY WM. FALCONER

CLEMATIS PANICULATA is the prettiest of its race for September flowers. Perfectly hardy, a good grower and sure bloomer, and, apparently, not affected by clematis disease.

MAURANDIA (Lophospermum) SCANDENS, for a fast growing, dense habited, free-blooming vine can hardly be surpassed, and from midsummer onward it is smothered in bloom. A tender perennial easily raised from seed or cuttings, but I prefer to treat it as an annual and raise the seedlings in spring. No good for cut flowers.

MAURANDIA BARCLAYANA, of various colors is fine where a small vine is needed, especially in dryish sunny places, and it blooms very freely. Treat it also as an annual.

MAURANDIA ANTIRRHINOIDES isn't nearly as large a plant as Barclayana, nor are its flowers as large. I grow it for variety's sake.

SOLANUM JASMINOIDES VAR. GRANDIFLORUM. The last week in September this handsome vine was still in full bloom out of doors, and so it had been for ten weeks before. Get it, keep it in a cool house in winter and plant it out in summer.

ARISTOLOCHIA ELEGANS.—I have this vine planted out on a trellis and it has grown rampantly and for the past two months been laden with its striking, showy, pipe like blossoms, a bud appearing at every leaf axil. A Brazilian vine easily raised from seed, and seedlings the second year make fine blooming plants.

MINA LOBATA is blooming better with me this year than ever before, but why, I don't know, for its cultural conditions are just the same as in former years. It always grows rankly, however. Easily raised from seed.

THE CANARY CREEPER is a very unsatisfactory vine with me. In some years it behaves fairly well, in others, as it has done this year, it acts miserably and will neither grow well nor bloom well.

QUAMOCLIT COCCINEA.—A pretty pest. Our good friends in the south would be glad to get rid of this annual vine as it comes up everywhere and spreads over everything, and although it is smothered in blossoms all the time, its pretty flowers hardly compensate for its rascally intrusion. In the north, however, it isn't so much of a pest, and I always find room for it. But John, you must stop calling it Ipomæa gracilis, for this is a mistake.

CYPRESS VINE sown in May are withered, ragged, seedy, and practically past some time ago, but those sown late in June are fresh and green and full of fiery, starry blossoms.

TACSONIA LÆVIS is a little beauty of a passion flower from Brazil. It loves good ground and a warm sunny place to grow in in summer when it blooms freely as it is now doing with us. A tender perennial vine gotten up from cuttings. This is what is commonly sold as Passiflora Smithii.

MOONFLOWERS never bloomed better than they have done this year. Even those I sowed in the open ground in May came into bloom the first of August.

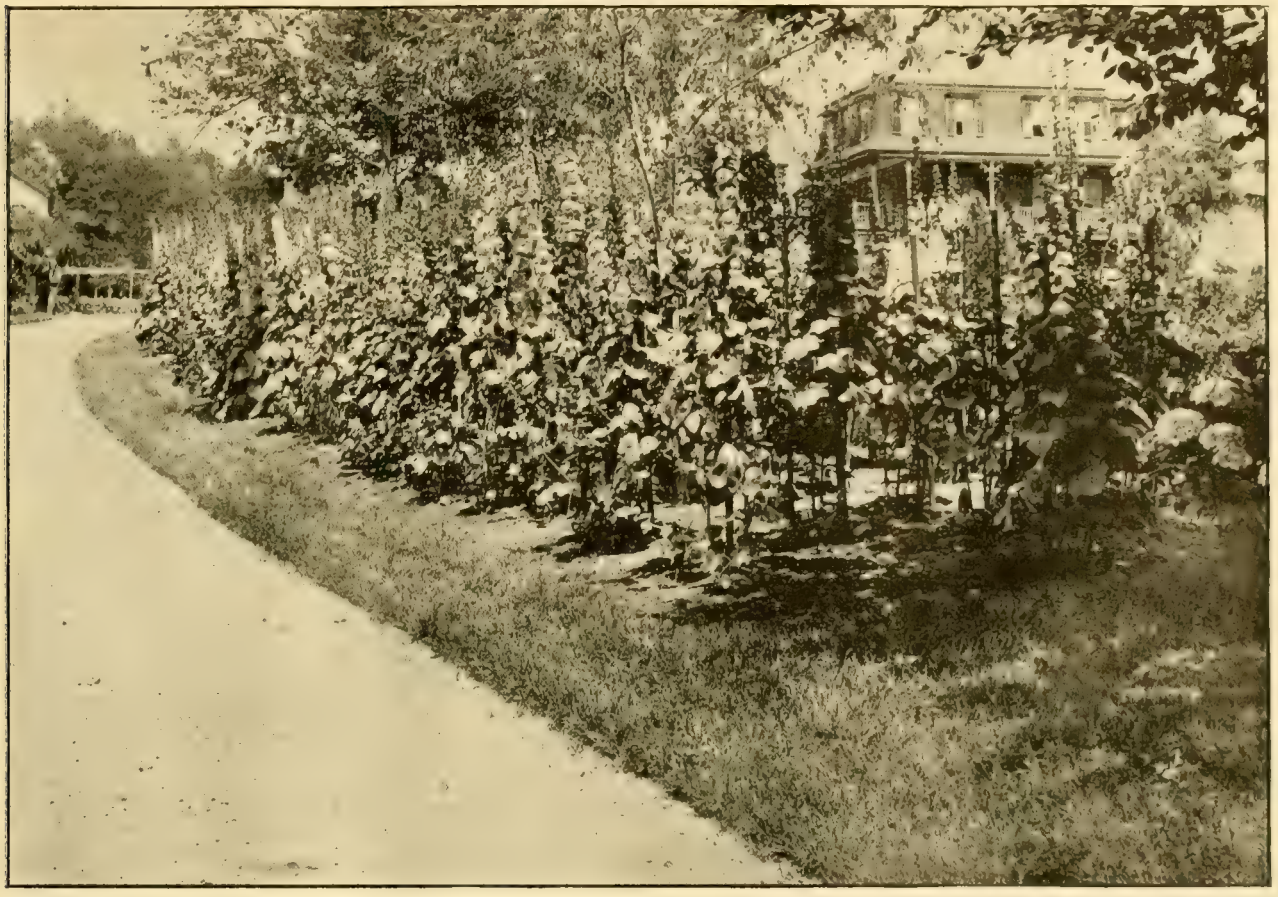
IPOMÆA LEARI, in the morning, is the most cheerful flower of its race with us, so luxuriant in growth and profuse in bloom, and so easy to propagate from cuttings, or seed either if you have them.

IPOMÆA HEAVENLY BLUE.—Mrs. Theodosia B. Shepherd of Ventura, Cal., sends me leaves, stems, flowers, seeds and photographs of this variety, and tells me that it originated in her grounds, and is, she believes, a hybrid between Ipomæa Leari and Mina lobata. She is in ecstacies over its supreme loveliness, and, certainly the photographs bespeak a wonderfully beautiful morning glory. Flowers of the size of I. Leari, but of the pure blue color of Salvia patens and without a trace of purple in them.

MUCUNA PANICULATA.—I had some seeds of this vine last spring; some of them were raised under glass and the seedlings planted out in May, others were sown out of doors in May. At first the plants grew slowly but after midsummer, rapidly enough and soon became very rampant Lima bean-like vines with axillary racemes of flower buds, and now it is beginning to bloom. The flowers are pea-form, but have not open showy "wings" like a sweet pea, of a bright chocolate color, and no doubt when borne in quantity and in long racemes are quite pretty, but I am inclined to regard it as rather late blooming for this part of the country. In the south, however, I am informed, it is grand.

MATRIMONY VINE.—At no time of the year has it been so full of bloom as it now (end of Sept.) is, but this may be on account of the exceedingly dry summer we have had. Still it isn't a desirable plant to cultivate.

THE MADEIRA VINE is now in fine bloom. Although it thrives admirably in hot, dry places, few plants are more grateful for good living than is this fleshy-leaved tuberous plant. But it likes good drainage.



THE MANETTIA VINE (M. bicolor) holds its own as a pretty little perpetual blooming vine. Plants raised from cuttings in the ordinary way bloom from the first, but those raised from rooted cuttings wait till they make considerable vine growth before they begin to bloom.

MANETTIA CORDIFOLIA has also strong friends, in fact many prefer it to bicolor, and when it is in bloom it really is very floriferous and attractive. But as a rule it doesn't bloom right away and so continuously as bicolor and I don't find it as thrifty or as easy to get up a big stock of in a hurry. I tell you it makes a customer feel pleased when he gets a plant and it is in nice bloom as bicolor is always wont to be.

DOLICHOS JAPONICUS.—Last spring we built a small wooden house and wished to cover it out of sight and quickly with vines. I lifted two big plants of this hardy vine and planted them in good prepared soil against the building and ran up strings to the eaves. By the end of June the walls were hidden by the dolichos. But beyond being a hardy, rapid growing, herbaceous vine with bold foliage it has little to recommend it—it has no floral beauty.

COBÆA SCANDENS is also a splendid soft-wooded vine for covering a building in a hurry. It is a tender perennial, but I treat it as an annual, and have it in fine condition into November. It blooms abundantly and both flowers and foliage will stand with impunity as much frost as a chrysanthemum.

AKEBIA QUINATA is a hardy wooded vine known to everyone. The remarkable thing about it this year is the great freedom with which it has borne fruit. Although this plant is exceedingly common, probably only a few of your readers have seen it in fruit. And there is something very curious about its fruiting. Age of the plant has nothing to do with it. The great majority of plants are absolutely barren, and the fruiting plants have to be propagated by layers or cuttings from fruiting plants, and it matters not whether the plant of the fruiting variety be one foot or ten feet high one year old or fifty years old, it will be apt to bear fruit, whereas the common or barren variety, no matter what its age or

HOLLYHOCKS ON THE GROUNDS OF J. S FAY, ESQ., WOOD'S HOLL, MASS.

size may be, never bears fruit, in this part of the country anyway, no matter how prodigiously it may blossom in spring or what may be the condition of the weather at the time. Some years ago I sent the fruiting variety to the Arnold Arboretum, and at the request of Prof. Sargent endeavored to trace the origin of our own and other fruiting plants that I knew of, and am satisfied they all had been obtained from one old plant in the possession of an old florist in this country, but the origin of his plant I cannot get at. Perfectly independent of this plant, however, fruiting plants have occurred in a few other places in this country and Europe.

About Hollyhocks.

We present herewith a view of a bed of hollyhocks as grown the past season at the summer home of J. S. Fay, Esq., at Wood's Holl, Mass., by his gardener, Mr. M. H. Walsh. Mr. Walsh at our request has favored us with the following practical notes upon the culture of this grand decorative plant:

Hollyhocks intended to flower next summer should be transplanted in October. Seeds sown in May or June will flower in July of the following year. Seeds sown in July or August will flower in August and early in September the year after. Hollyhocks delight in rich, dry soil; the ground should be dug two feet deep and well enriched with barnyard manure. They should not be planted too close together, 3x3 feet at least, and 3x4 feet for handsome plants and good specimen flowers.

About the 1st of December the plants should be protected by laying on the crown of the plants a branch or two sufficient to keep the barnyard litter or leaves from pressing too heavily and causing the crown of the plant to decay; six or eight inches of leaves or litter is sufficient, care being used not to put too much on the crown, putting most around the plant.

In the spring, about the 10th or 15th of March, about half of the covering should be removed, shaking up lightly over the plants the other half. If the covering remains on too long, the plants will become drawn and the shoots weak and liable to suffer from the late spring frosts. During May and June they may receive abundance of water, as the stalks and foliage absorb a great deal of moisture.

Flowers intended for exhibition should be grown one spike or shoot to the plant. When about 4 or 5 feet high the top should be cut off, when fine exhibition flowers are needed. The shoots should be tied to stakes when they attain a height of 18 inches or 2 feet.

Young plants should be set out every two years, although some that we set out and that remained in the same bed 4 years grew remarkably well and attained a height of 8½, and some 9 feet, this year.

This year we had in flower 350 plants of 16 distinct colors (double flowers). Average height, 8½ feet. In August a second lot from seed sown in the open ground August 22, 1890, came into bloom with extra fine double flowers in 18 distinct colors, and attained an average height of 6½ feet.

I have raised two new seedlings which flowered this year, one extra large and white, tinged with yellow in center, the other yellow tinged with purple, remarkable for size, form, and distinctness.

New York Chrysanthemum Show.

The great Madison Square Garden Chrysanthemum Show which is to take place November 2 to 8 is the all absorbing topic among not only the local growers but among prominent experts and fanciers all over the country. The inducements held out by the management of the Garden in the way of premiums at the beginning, were very liberal and all the arrangements were planned on a most generous scale. But the success of the undertaking has now been doubly assured by the announcement that the show will be under the auspices of the New York Florists' Club, and the placing of the entire arrangements in the hands of a committee, a majority of the members of which are the most prominent and active members of the club.

The regular weekly meeting of the committee was held on Tuesday, Sept. 29, Mr. Adolph Ladenburg, chairman. The proof of the complete schedule received its final revision, various matters relating to decorations of the hall, judges, advertising, etc., were thoroughly discussed, and it was confidently predicted by those in a position to know, that this will be the greatest floral exhibition ever held in America.

The premiums offered amount to $6,500, are very comprehensive and are large enough in all the classes to excite a lively competition. In addition to the regular prizes special premiums in the shape o cups are offered by Mrs. Henry Clews Mrs. W. C. Whitney, Mrs. Edward Wins

low, Mrs. Herman Oelrichs, Mrs. J. F. D. Lanier, Mrs. A. Ladenburg, Miss Bird, Mrs. Astor and others for new varieties, seedlings, etc.

Splendid cups are also offered by U. S. Nurseries for cypripediums, by J. H. Taylor for Mme. Cusin roses, and a gold medal by president-elect James Dean of the S. A. F., for model of a greenhouse for amateur use.

The Vanderbilt prize will be awarded on Tuesday for the best collection of novelties introduced during the spring of 1891. Seedlings will be the special attraction for Wednesday; dinner table decorations for Thursday, and mantel decorations for Friday.

A large amount of money has been appropriated for the decoration of the building. A flower table presided over by young ladies in Japanese and Chinese costumes will be one of the special features.

All friends of horticulture who know the discouraging outcome of last spring's effort by the New York Florists' Club, when their superb exhibition at the Lenox Lyceum met with such scant support from the public, will certainly now unite in wishing for them in the coming show the full measure of success which their accomplishments and abilities as well as their plucky persistence in the face of successive discouragements entitles them to, and which the support and backing of such a powerful organization as the Madison Square Garden Co. would seem to make reasonably certain.

The complete schedule of prizes may be had by applying to Mr. Jas. W. Morrisey, Sec'y, Madison Square Garden, or from any of the officers of the New York Florists' Club.

New York.

The cut flower trade is at its worst. Growers, wholesalers and retail men all agree that the market is in a terribly bad way. During the last two weeks in September there were enormous quantities of roses unloaded at from $5 to $10 a thousand. Carnations also have been in excess of the demand. The only thing that seems to sell well as a rule is the American Beauty rose. Prices range at from $5 to $15 per hundred, according to quality. There are a good many fine ones coming in. Slaughter, Connelly, Noe, Nash and Peter Henderson & Co. are all sending exceptionally good specimens, fine flowers, clean foliage and long stems.

A prominent retailer says the only thing he can sell is something which it is impossible to get, cattleyas for instance. Orchids have sold well all summer, cattleyas taking the lead, but there has been no trouble to dispose of good phalænopsis, vanda or odontoglossum sprays. There are some double violets in the market. They bring from 75 cents to $1 per 100. The first chrysanthemums are beginning to appear, half a dozen here and there. The chrysanthemum season promises to be a long one this year.

The New York Florists' Bowling Club held its regular semi-monthly meeting on Monday, Sept. 8, in the afternoon. After a practice game in which Burns covered himself with glory and Manda tried to drive the balls through the end of the building and thus open up a new avenue to Harlem, Asmus meanwhile acting as chief watcher of the chalk line, the meeting settled down to parliamentary business, Theo. Roehrs in the chair and C. B. Weathered secretary. The question of a couple of friendly matches with the Philadelphia boys at the time of the chrysanthemum shows for a trophy to be contributed by the two clubs was earnestly discussed and Messrs. Keller, Burns and Asmus managed to get in some fine parliamentary work which is not laid down in Cushing's Manual. A prerequisite to membership in the bowling club is that the candidate shall be a member in good standing in the New York Florists' Club.

The next meeting of the Florists' Club will be held on Monday, October 12, when the nomination of officers for the ensuing year will be in order. Mr. Wm. Tricker, of Dongan Hills, will read an essay on aquatic plants and is expected to make an interesting exhibit of these flowers at that time.

Both auction houses have been having plant sales every Tuesday and Friday, the great bulk of the stock sold being palms. Prices naturally vary considerably at the various sales, but certain standard varieties which are found at every sale soon come to have an approximate auction value and where quality is equal prices hold pretty near to the average. Araucaria excelsa, 18 in., averages $2.50 to $3 each; kentias, 4 to 5 ft., $5 to $8; Pandanus Veitchii, 1 ft., $1, 2 to 3 ft., $2.50 to $3.50; Ficus elastica, 5 to 6 ft., $3; Phœnix rupicola and reclinata, 3 to 4 ft., 10-inch pots, $3 to $5; Dracæna Lindenii, 2 ft., $3. Specially well grown and perfect specimens are very likely to bring fancy prices. Nothing varies more in prices received for plants of equal age than Latania borbonica. With perfect leaves and short stocky growth it will bring two and sometimes three times as much as a drawn up or imperfect plant. As a rule very small stuff goes badly, specimen plants of suitable size for decorations appearing to be most in demand. Assorted ferns in boxes or baskets from 3 or 4-inch pots average $4 to $5 per 100. Dutch bulbs of most kinds are bringing pretty near their market value. Narcissus Von Sion frequently brings more than market value. Neat little orange trees about 15 inches with fruit on average $1.50 each.

Boston.

The period of inactivity in the cut flower trade still continues, and the weather has been favorable to over-production. The great abundance of carnations, roses and tuberoses gives a harvest to the street fakirs, who can get large quantities of stuff for a song, and who line the curbstones in favored localities as thick as flies. In all the stores quiet reigns, for customers have not returned to town and occasional transient custom is all that comes. Faith in an early improvement is qualified by the reflection that this is election year, and that for the next four weeks politics will have the upper hold. One thing is assured for the coming season, and that is the continued popularity of the American Beauty rose. This rose sells steadily, no matter what may be the fate of other varieties.

It is too early to predict the measure of favor which will be given to the Waban. A fair amount of these are coming in, but they are small-sized as yet, although the color is very fine.

The annual election of officers and standing committees of the Mass. Hort. Society occurred on Saturday, October 3. There was no opposition of any kind manifested toward the regular nominations, which were almost without exception the same as those elected a year ago, so the organization remains the same as last year. This is Mr. Spooner's third election to the office of president and is a well deserved recognition of an administration under which the society has prospered exceedingly.

On the same date occurred the annual fall show of fruits and vegetables. Much favorable comment was passed on the fine appearance of the exhibits, the pears and grapes being especially good. It would be well to consider the advisability of making this the great annual fruit and vegetable show, instead of holding it as heretofore in the middle of September, for with the great majority of varieties the first week in October is nearest to their time of perfection in this latitude. The very few early varieties could be adequately represented at the smaller Saturday shows.

October 3 being prize day for perennial asters, a very attractive exhibition of these autumn favorites was made. The collection shown by George Hollis comprised over 50 species and varieties, and was rich in rare and new kinds, some of which were his seedlings of 1891. One of the latter was the finest thing in the aster line ever shown here. The flowers were of a bright amethyst in color, and measured two inches in diameter. A nice plant of Cattleya chrysotoxa was shown by L. H. Farlow.

Mr. William Plumb, of Riverdale, N. Y., has been in town interviewing the chrysanthemum growers with a view to having Boston well represented at the coming Madison Square Garden exhibition.

Philadelphia.

Business the past week has not had the snap to it that some would like to have seen. Society folks are coming home and many familiar faces are seen on the streets, yet business doesn't pick up like it ought to. Some florists want to blame the English cricketers who have been playing here the past week. The elite have been present in large numbers at the matches as the weather has been fine, but we hardly think it fair to blame Lord Hawke and his cricket team for our troubles. Two or three days of cool weather will stir things up considerably, it will make flowers scarce at any rate, and business generally gets brisk when flowers are scarce, at least we hardly ever knew it to fail.

Those who make a specialty of decorating were very busy the past week. Almost all the large stores on Eighth street and on Chestnut were decorated with palms and greens; on Eighth street it was like a horticultural exhibition both inside and out; the stores were lined with palms and other foliage plants, and we doubt if there are any asters left. Wanamaker's cloak department was profusely decorated, a great deal of smilax being used in addition to the plants which were placed wherever there was an inch of spare room; the effect was very fine.

The Floral Exchange has made quite a difference in the appearance of the store at 618 Chestnut street. The old front has been torn out and a new one entirely of copper and of a very pretty and unique design has taken its place. The center window is in the shape of a large oval, the door also being of similar design; all glass used is bevel edged and as the store is some four steps down from the street with an area in front, the effect from above is very fine. They are also building two more houses at their nursery near Bristol, to accommodate spring bedding stuff which they grow largely for auction.

Mr. Joseph Heacock is to read a paper before the Florists' Club at the next meet-

GERANIUM BORDER AT WASHINGTON PARK, CHICAGO.

ing on the best way to wholesale cut flowers. We hope he will give us some new ideas on this subject, for we believe that if reform is needed anywhere in the business it is right here, and we think the National Society could devote a day to the discussion of this subject with profit.

Pandanus utilis is very scarce in Philadelphia; few, if any, of the large growers have it in stock; last year it was very plenty and the cheapest plant the decorator could use. X.

Toronto.

The exceedingly warm weather has left us for a time, at any rate, and there seems a chance of getting something a little cooler and more seasonable. There have been slight frosts in exposed situations, but in sheltered spots coleus and other tender plants still flourish. Such warm weather so late in September has not been known here before, at least for 50 years. Growers have been grumbling considerably, but are feeling better now.

Mr. J. H. Dunlop's promising new rose "Toronto" will be exhibited at many of the coming chrysanthemum shows, both in the United States and Canada. I had the pleasure of seeing a batch of it on the bench growing side by side with "Perle" and the difference is certainly most marked in favor of the "Toronto."

Chrysanthemum growers are beginning to get a little feverish as the time for the show draws near. The bug is about, and has been doing considerable damage, but still the prospects are good for a fine show.

Now that the great Industrial Exhibition is over, the city has relapsed into its normal condition, and trade is dull for the time being in consequence, and no doubt will be dull until winter begins to assert itself. However, Christmas is coming!

Mr. A. H. Ewing, secretary of the Gardeners' and Florists' Club, mourns the loss of his little daughter, aged 2 years, who was taken from him by death September 28. Mr. Ewing has the sympathy of his many friends in the trade.

Detroit, Mich.

A feature in the horticultural department of the recent Fair and Exposition was the display of palms which filled the entire center of the main hall, occupying a space 75 feet long by 15 or 18 feet wide.

J. Breitmeyer & Sons took first prizes for palms, stove plants, different varieties of cut roses, table decoration and bouquet, the Detroit Floral Co. taking second in each of these classes and first for basket and general design. The design was a fan, the second prize arrangement being a large urn.

John Schneider took first prizes for tuberous begonias, tuberoses, asters, geraniums, etc. (plants in pots), and J. Bogula both first and second for outdoor carpet and flower beds.

The third annual Chrysanthemum and Floral Exhibition will be held at the Detroit Rink November 3 to 7, under the auspices of John Breitmeyer & Sons, Holznagel & Noel, Detroit Floral Co., and Bruno Schroeter. S.

A Long Geranium Border.

The accompanying engraving, giving a view at Washington Park, Chicago, shows a portion of the long border of geraniums that encircles the main display of bedding there.

This border is 1,853 feet long and 5½ feet wide and contains 11,655 plants of the following varieties: Clement Boutard, Ralph, Adam Blumenschein, Rev. Wm. Atkinson, Diamode, Dr. Jacoby, Sapeur Pompier, Pres. Leon Simon, Waddington, Golden Dawn, Ernest Lauth, S. A. Nutt, Double Gen. Grant, Madam Messenger, Candidissima plena, Single Gen. Grant, and Bruant, which was received some years ago under the name of "Clippert".

These geraniums make a brilliant display all summer long and as will be noted Superintendent Kanst has retained many of the kinds that have been discarded by some growers. Many of these could be much improved upon, but though Mr. Kanst has tried a large number of the newer sorts he has found none that averaged up better for bedding than several of the older kinds.

HOME-GROWN VS. IMPORTED PALMS.

Certain matters touched upon in an interview with Mr. Robert Craig in another column of this issue are worthy of more than a passing thought. The community of growers about Philadelphia, of which Mr. Craig is a leading spirit, is noted for the fraternal intercourse which exists between individuals in the trade. There more than elsewhere in this country, probably more than anywhere else in the world, do the members of the craft compare notes, exchange opinions and consult together with social cordiality as to ways and means, methods of culture and business management.

Naturally under such conditions they are intelligent and their opinions carefully formed, and when a man of acknowledged broad vision such as Mr. Craig, speaks as the mouthpiece of the Philadelphia trade, his words carry conviction, and we cannot feel but that he knows what he is talking about.

His argument for the encouragement of home industry is based upon that best of all foundations, superior goods. The fable of the goose that laid the golden egg has on more than one occasion been fully exemplified and its logical results attained by the shortsightedness and folly of the European trade, who have too often for their own good looked upon America as a dumping-ground for inferior productions.

At the outset, through our inexperience, goods which would go a-begging in Europe may be easily forced upon us, but it is not long before we begin to know better. In their contemplation of our crudeness they overlook our ambition and forget that we do not propose to stand still. The best is none too good for us, and in the long run we find a way to get it.

If our brethren in Philadelphia or elsewhere succeed in proving to us (and there is no good reason why they should not) that home-grown palms and other plants can be produced at equal prices and in better quality than the stuff usually imported, they will be sure to receive substantial support from American buyers, and our friends across the water will find that they must either give us better goods or take the consequences.

AN AMERICAN CARNATION SOCIETY.

A meeting of interested carnation growers has been called to attend a meeting to be held in Philadelphia October 15 at 2 p. m., the object being to organize a society as above. It is to be hoped that the foundation will be laid broad and strong, and that no effort will be spared to make the society a worthy custodian of the interests of this flower which has so rapidly gained in popularity during the last few years and which is unquestionably destined to make even more rapid progress in the future.

LATE ADVICES from Holland indicate that all main stocks of fall bulbs are selling out rapidly, and that there is no surplus to be expected which will have to be slaughtered.

And Still Another Carnation Contest

At the Madison Square Garden Chrysanthemum Show, which is to be held under the auspices of the New York Florist's Club November 2 to 8 inclusive, a silver cup, value $25, is offered for best seedling carnation, not less than 12 blooms, never before exhibited. Verily the Divine Flower is forging ahead.

E. L.

Chicago.

The annual meeting of the Horticultural Society of Chicago, held last Saturday evening, was a most interesting one. Officers for the ensuing year were elected as follows: Wm. H. Chadwick, Pres.; F. C. Vierling, 1st Vice-Pres.; E. G. Uihlein, 2nd Vice-Pres.; J. A. Pettigrew, 3rd Vice-Pres.; G. L. Grant, Sec'y; H. H. Hindshaw, Ass't Sec'y; Gen. A. L. Chetlain, Treas.; Directors, J. T. Anthony, Dr. Wm. E. Clarke, George Gardner, C. R. Williams, Jonathan Periam, J. C. Vaughan.

After the election and the consideration and adoption of by-laws, Mr. John Thorpe read a paper on the possibilities of floriculture at the World's Fair which appears elsewhere in this issue, and Mr. Wm. H. Chadwick read a very interesting and valuable essay on exotic orchids which will appear in full in these columns next week. Both essays were received with applause and the thanks of the society tendered to the essayists. Mr. Thorpe spoke of Mr. Chadwick's essay as the most valuable paper on orchids he had ever had the pleasure of hearing. Chief Samuels of the Horticultural Department of the World's Fair, was present and in response to a call by the chairman made a short address regarding the work of his department. The meeting did not adjourn until 11 p. m. and the interest was maintained to the end. The report of the executive committee indicated that the coming exhibition will be far in advance of any previous one. The local press is taking great interest in the work of the society and the Sunday papers gave very full accounts of the proceedings. The society is now fully organized and the members feel that it is destined to accomplish much in the advancement of horticulture in this city and vicinity.

Among recent visitors to the city were Mr. W. W. Hall of S. J. Burnham & Co., New York; Mr. M. A. Hunt, Terre Haute, Ind.; Mr. James Semple, Bellevue, Pa.

WORLD'S FAIR NOTES.

It is feared that the Music Hall will be placed on the Island, and it is also said there may be a farm on the Island (an ostrich farm). It is hoped this is not true, but the demand for space is such that with the 700 acres at disposal every department will be crowded.

Applications for space in the whole of the Horticultural Department are received daily and as soon as the new classification is issued, which it is hoped will be within a week, then the applications will be still more numerous.

Chief of Floriculture Thorpe had put on board for the Royal Commission on the Majestic October 7, at New York, a very handsome floral piece by Siebrecht & Wadley. The commissioners were Sir H. Wood, H. Dredge, Emil Meyer, Herr Wermuth and T. McCormick.

OBITUARY.

ANTOINE LEVET, the well-known French rosarian, died at his home in Lyon, France, August 21, aged 74 years.

He was the originator of the Perle des Jardins, and if his work had ended with the introduction of this rose alone the rose growers of America would still have been under lasting obligations to him, but he also gave us Paul Neyron, F. Michelon, Reine Marie Henriette, and a host of others.

Ellwanger, in his list of 32 rosarians who have sent out two or more sorts of good repute, places Antoine Levet fourth in the list, which indicates the value of his introductions.

The Seed Trade.

AM. SEED TRADE ASSOCIATION.

F. BARTELDES, Lawrence, Kan., president; A. L. DON, New York, secretary and treasurer. The tenth annual meeting at Hartford, Conn., second Tuesday in June, 1892. Applications for membership should be addressed to Wm. Meggatt, chairman membership committee, Wethersfield, Conn.

Boston.

James C. Elms, trustee of M. B. Faxon, assigned, reports his estimate as follows:

Liabilities	$16,684.13
Assets, bills receivable (good)	$1,183.34
Assets, bills receivable (doubtful)	217.00
Assets, stock	4,054.71
" fixtures	400.00
" cash	463.81
Total assets	$6,318.86

Less cost of administration.

Mr. Faxon offers 36 cents on the dollar, cash, provided all creditors accept.

It will be noticed that good will and lists of names of customers are not included in the assets.

THE CENSUS BULLETIN on seed farms is out and can be had of the Department of the Interior at Washington. Experts will question the value of the data in many of the tables. For instance, the reported acreage planted to beans in Illinois is 2,860; in New York, 4,600; in Michigan, 2,600.

WASHINGTON, D. C.—There appears to be a good opening here for a good seed store, as there is comparatively no place where flower seeds can be bought, whatever seed trade is done here being confined to agricultural establishments only.

MR. S. F. LEONARD, of Chicago, has leased the new 7-story corner building at 153 & 155 West Randolph street; he will utilize three floors for his business and sub-let the remainder.

MR. ALEX FORBES, of P. Henderson & Co., is slowly recovering from a severe attack of typhoid fever.

VISITED CHICAGO: E. M. Wood, Chas. N. Page.

News Notes.

DELTA, COLO.—H. A. Parcells is removing his greenhouses from Glenwood Springs to this place.

BALTIMORE.—William J. Halliday, of 304 W. Madison street, has opened a new store at 316 North Charles street.

NORTHAMPTON, MASS.—Thomas W. Weathered's Sons are building and heating a range of new houses, comprising about 7,000 feet of glass, for I. J. Allen.

CINCINNATI.—When the new flower market is completed the Cincinnati Florists' Society will have a very convenient and suitable place of meeting. Until that time the meetings will continue to be held at 134 Walnut street.

SOUTHAMPTON, N. Y.—Mr. William F. Halsey, formerly of Water Mill, N. Y., has located here, and has built three new greenhouses. He has taken a partner, and the business will be carried on under the firm name of Halsey & Edwards.

MINNEAPOLIS, MINN.—Mr. Wm. Desmond having been committed to the Insane Asylum, Mr. Gust Malmquist has been elected to succeed him as president of the Minneapolis Florist Club. For the recent industrial parade Mr. R. J. Mendenhall had a greenhouse built on a truck and filled it with plants and flowers. It proved a very taking feature of the great procession.

PATERSON, N. J.—Alderman H. E. Chitty, the florist, who is chairman of the committee on parks, recently made a report to the council severely criticising the management of the city parks, and recommending "that no further appropriations be made for our parks until the services of a practical superintendent are secured for their supervision and management."

SPRINGFIELD, MASS.—At the meeting of the Amateur Hort. Society, Sept. 18, Mr. Robert Farquhar of Boston, gave a pleasant and interesting talk on Holland bulbs and their culture. There was a large attendance and although the evening was quite warm the meeting was prolonged beyond the usual time in order to give all an opportunity to take part in the discussion and ask questions. Mr. Farquhar was made an honorary member of the society.

GLOUCESTER, MASS.—The annual exhibition of the Cape Ann Hort. Society was held on September 25 and 26. It was well attended, and was a success in every way. A magnificent show of ferns and foliage plants was made by H. W. Clark, gardener to Col. Jonas H. French. Mr. George Todd made a fine show of tuberous rooted begonias. Notable displays of plants and cut flowers were made by S. Curtis, Jr., Mrs. A. M. Lane, Mrs. S. W. Oakes, Mrs. J. H. French, George Todd, George F. Thayer, and others. The show of fruit, especially pears, was very complete.

WHEN you write an advertiser tell him that you saw his advertisement in the AMERICAN FLORIST.

WHY You Should Grow Mushrooms.
Because they are the most profitable crop for the outlay that can be grown and may be grown without interfering with other crops. The market is sure, the supply never having been equal to demand.

WHEN You Should Grow Mushrooms.
During the Winter and Spring months, the first planting in August or September with successional planting until April.

WHERE You Should Grow Mushrooms.
Under the greenhouse benches, on the greenhouse benches among growing crops, in Rose Houses, in frames in the greenhouse, in cellars, stables or outhouses, in the open field or in mushroom houses.

HOW You Should Grow Mushrooms.

First get spawn that will grow. It must be fresh, well spawned, and in good condition. **Gardiner's Celebrated English Mushroom Spawn** is the best, and is always fresh and reliable. The details of culture are given concisely in our treatise, **"Mushrooms for the Million,"** Mailed free. **Falconer's "Mushrooms and How to Grow Them."** Published at $1.50. (Gardiner's price $1.35 post free.) **Robinson's "Mushroom Culture,"** 50 cts. postpaid.

GARDINER'S ENGLISH MUSHROOM SPAWN.

John Gardiner & Co., have made a specialty of choice spawn for years, and their celebrated English brand (made by the best maker in England, specially for their trade), has gained an enviable reputation among critical growers for its uniform good quality, and can be thoroughly relied on to produce a good crop of the best mushrooms. Orders booked now for delivery as wanted, $8.00 per 100 lbs. Special rates to large growers. Address all correspondence to **21 North Thirteenth Street,** Philadelphia, Pa.

ADDRESS:

AMERICAN FLORIST CO.

54 La Salle Street, CHICAGO.

Arlington, Va.

The alternantheras, both red and yellow varieties, in the formal beds at the National Cemetery are unequaled in gorgeous coloring this season. If "ribbon bedding" always turned out as well as in this instance, much of the criticism against it would be disarmed.

The rose beds are a mass of bloom. One of the best varieties here is Mme. Lambard. It is particularly good this year.

Canna Geoffrey St. Hilaire is simply grand. Its massive dark foliage and showy spikes of orange vermillion flowers loom up magnificently in the ornamental grounds.

A new form of bedding nasturtium, with pale green, almost golden foliage, is very effective in a low bed.

There are many handsome evergreen trees about the old Lee mansion, prominent among which are the beautiful Deodar cedars and Pinus excelsa, and there is a fine specimen of Retinospora filifera pendula aurea.

Never Ate Orchids.

An Ohio daily paper is having lots of fun at the expense of a certain judge who made a political speech lately. He talked about the tariff, and said that the things the rich men use were put on the free list, while the things the poor men use were placed on the dutiable list. "There's attar of roses, there's bird's nests, and then there's orchids." He said: "Orchids! How many people eat orchids? I don't believe there is a person in this audience who ever ate an orchid!" exclaimed the learned judge. And right here it is not out of place to say that the audience fully agreed with him. We do not believe there was a person in that audience who ever ate an orchid.

THE FAKIR.—Mr. W. A. Lee, Burlington, Vt., calls our attention to the fact that the city dealers are not the only ones injured by the fakirs and says that frequently when he asks a proper price for a spike of tuberose blossoms for instance the customer will exclaim, "why, the boys sell them on the streets in New York for 5 cents!" So it would seem that the influence the fakir exerts in the demoralization of prices is not confined to his immediate field of operations.

Roses.

STRONG, HEALTHY PLANTS.

When writing to any of the advertisers on this page please mention the AMERICAN FLORIST.

American Pomological Society.

At the recent meeting of the American Pomological Society at Washington, Messrs. Ellwanger & Barry, Rochester, N. Y., exhibited a collection of 116 varieties of pears; the state of Virginia displayed 350 plates of fruit, among which there were 163 varieties of apples, and Wisconsin, Indiana, Massachusetts, Missouri, Maryland, and Florida each made large exhibits of fruit. Specimen fruits were sent from California, Kentucky, Tennessee, Mississippi, and New Jersey.

Officers for the ensuing term were elected as follows: P. J. Berckmans, Augusta, Ga., president (re-elected); C. L. Watrous, Des Moines, Ia., vice-president; G. C. Brackett, Lawrence, Kan., secretary; Benj. G. Smith, Cambridge, Mass., treasurer.

Mr. J. M. Samuels, Chief of the Horticultural Department of the World's Fair, was present, and conferred with the society regarding the pomological display at the great exposition. He was very cordially received, and was promised the influence and hearty support of the society toward making the pomological division what it should be.

Invitation was extended to the society by the World's Fair management, through Mr. Samuels, to meet in Chicago in 1893. This was referred to a committee, as is the usual custom. A majority of the committee expressed themselves as favorable to meeting in Chicago.

If you are a grower of plants or cut flowers, then you are a manufacturer just as much as one who makes sewing machines or wash tubs. Any manufacturer of these last named articles knows exactly what it costs him to produce these ready for the market, and manufacturers of plants and flowers can be equally as well posted if they will take an equal amount of trouble to find out.

When writing to advertisers please mention the fact that you were induced to write by the advertisement in the American Florist. You will benefit us by letting advertisers know that it is the Florist that is bringing them trade.

Address ***AMERICAN FLORIST COMPANY,***

54 La Salle Street, CHICAGO.

HOW CAN I make the florists write about printing Catalogues NOW instead of in January? If they could see me weep big salty tears about those I *can't* do THEN, but which I could fairly jump on NOW for less money, may be they would have pity! I want to print Catalogues right away—I am hungry to do good Catalogues, better than ever, pretty, and all that. But in December and January I'll be stuck-up and proud, and probably won't care a darn for any more orders, 'cause I can't work more'n 27 hours a day. *Do* come along now—I am yearning for you! Drop a letter in the slot—J. Horace McFarland, Harrisburg, Pa.—and watch a Catalogue come flying back!

THE CHEAPEST AND BEST OF ALL.

FIR-TREE OIL

INSECTICIDE—soluble.

FOR PLANTS.—To make a solution for washing or cleansing purposes—Half-a-Pint of Fir-Tree Oil to ten gallons of water.

For Green and Black Fly, Thrip, American Blight, Wooly Aphis, etc.—Half-a-pint of the Fir-Tree Oil to two or four gallons of water, or two or three tablespoonfuls to the pint.

For Red Spider and Caterpillar—Half-a-pint of the Fir-Tree Oil to two gallons of water, or three tablespoonfuls to the pint.

For Mealy Bug, Brown or White Scale—Half-a-Pint of the Fir-Tree Oil to four or six quarts of water, four to eight tablespoonfuls to the pint.

For Mildew and Blight on Fruit or Foliage—Half-a-Pint of the Fir-Tree Oil to a gallon of water, or six tablespoonfuls to the pint.

Used with warm water it is quicker in its action than when cold is used.

Soft or rain water is necessary, and Applied in Wood, Tin or Pot Vessels.—Galvanized Iron Vessels must not be used.

FOR ANIMALS.—For Skin Diseases and Killing Vermin mix one part of Fir-Tree Oil with three parts of warm water and wet the affected part each day. In some cases it may be used stronger. For Ring-worm apply full strength with a brush each day.

FOR BIRDS INFECTED WITH PARASITES.—Put a tablespoonful of Fir-Tree Oil in one quart of warm water and dip the bird in it, taking care that its eyes are protected, hold the bird in one hand for one minute, then dip into clean tepid water; this may be repeated. If necessary a much weaker solution may be used with a spray producer.

Sold in Bottles and Tins.

W. E. SMITH,

Successor to SMITH & SMITH,

KENTON, Hardin Co., O.

Gladiators for the Poor.

Yesterday the Moderation Society at Five Points for the second time this year distributed flowers to the poor people of the Five Points district. The Society's big red wagon, loaded with gladiators, apple blossoms, striped tulips and spotless lilies, drove up by the music stand at 3 o'clock and Mr. Sylvanus Lyons, vice president of the society, began scattering his treasures to the immense crowd of men, women and children that swarmed from every hovel and tenement house round about.

The above item, clipped from a New York daily paper of Sept. 26, is sent us by Mr. J. Kadletz of Dongan Hills, N. Y., who comments as follows: "I feel sympathy for the poor who had gladiators thrust at them; but no doubt it was very pleasant to get apple blossoms and striped tulips on the 26th of September."

FIRE INSURANCE.—In answer to the query by R. A., only a few companies accept risks on greenhouses and their contents, and when such risks are accepted the rate varies for each individual risk, according as it is believed to be more or less hazardous. The rate named (1½ % on the greenhouses and 2% on contents) seems high, but probably no lower rate could be obtained as matters are now conducted by the companies. On page 994 of volume 6, our issue for July 20 (No. 165), we printed a list of the companies that take risks on greenhouses.

THE GREENHOUSES of the B. & O. R. R. at Connellsville, O., sent out the past season 18,000 bedding plants which were used to beautify the grounds around the various stations on this line. The attractiveness of this route has been very considerably increased by this decoration of station grounds and the road is entitled to much credit. The greenhouses are in charge of Mr. Neil Queen.

THE CEFREY FLORIST LETTER CO. of Boston has changed its name to the "Boston Florist Letter Co."

A. H. HEWS & CO., CAMBRIDGE, MASS.

Mention American Florist.

AHEAD OF EVERYTHING.

We Follow None, Prize or No Prize.

Our latest improvements in machinery produce a Standard Pot which for lightness, smoothness and durability, has never been equaled. Customers buying of us will

SAVE ONE-THIRD IN FREIGHT.

And to prove this, we give below a table showing number in Crate and **WEIGHT** of same, which speaks for itself:

Size.	No. in Crate.	Weight.
1¾-inch	3,000	250 lbs.
2 "	2,400	250 "
2¼ "	1,750	250 "
2½ "	1,450	250 "
3 "	1,280	350 "
3½ "	800	350 "
4 "	600	350 "

It will be seen at a glance, that our pots are one-third lighter than formerly, and yet we claim that owing to the superior quality of our clay and improved machinery, they are stronger than any pot in the market, and we frankly ask you to make the test. ☞ SEND FOR PRICES.

Exotic Orchids.

BY WM. H. CHADWICK.

[*Read before the Horticultural Society of Chicago Oct 3.*]

The orchid family is very widely distributed, those genera of which I shall speak existing mainly between the isothermal lines of 70 degrees on either side of the equator, forming a comparatively narrow zone around the earth, some few of them growing in shady places, but the majority reaching out for light and air, many climbing high up on trees.

Generally speaking, they are difficult to collect, and some species are transported from their habitat to any considerable distance at the imminent peril of losing every plant.

The botanical position of orchids is quite low among phanerogamous plants, indeed there is reason to believe that all endogenous plants are botanically recent and if this be true, it is so especially of the tree-climbing orchids of the warmer parts of the globe. While the coal measures of the earth preserve in rock caskets the beautiful imprint of delicate ferns, no geological traces of orchids have ever been found; and this fact may be considered as supporting the views I have mentioned.

Some botanists advance the idea that all flowers of the earliest plants were probably green and point to such instances as the green rose, which occasionally crops out, as evidences of atavism or reversion; the next step is thought to be toward yellow flowers, then white or nearly white, while red is a still higher grade, the climax being reached in blue, the celestial color. There is no blue orchid; the nearest that now occurs to me being Vanda cœrulea, but one cannot call the color of that flower a real blue; one or two have, it is true, an apron of blue, as has Zygopetalum Gautieri, etc., but even then it is only a nice, bright purple and not a true blue.

The weight of the argument seems to place orchids among the more recent additions to Flora's lovely kingdom; and her practiced hand seems to have outdone its previous work, for they are generally of convenient size, boasting but few giants, are unguarded by unpleasant defences, as thorns, while the flowers of many are confessedly beautiful and but few give off any but agreeable odors. Under cultivation the sobralias stretch out their reed-like stems to as much as 8 feet in height and some orchids throw up long stems of flowers, but as a rule the plants are low in stature and present their flowers in a pleasing manner.

Apparently designed to give so much pleasure, it seems eminently fitting that the family should not furnish much beyond the beauty of many of its members and this seems to have been the plan, for I do not recall any orchid of economic value besides the vanilla. Vanilla is prepared from the cured seeds of several species, largely from Vanilla aromatica.

Orchids are of perennial growth and many genera are a number of years in arriving at flowering age and in a state of nature they are long lived, some orchids having been found that are undoubtedly a hundred or more years old. As now cultivated some give more abundant bloom than in their native homes; when the management of a particular variety is perfectly understood and administered and it is protected from the vicissitudes to which they are more or less exposed in a state of nature, this may not be at all unreasonable.

Orchids being only weeds at home, we have to select the best and discard the black sheep, as with other things. The number of varieties is very great, among the thousands; more than 2,000 species have been described and in many species there are a great number of varieties, while new ones are constantly being found, and in addition the cunning hand of the hybridist is rapidly swelling the list. The island of Java alone contains more than three hundred species.

The public occasionally reads of great sums paid for orchid plants and it is true that individual orchids have commanded a thousand, twelve hundred, fifteen hundred, while the late Mrs. Morgan is alleged to have given $3,000 for a plant of Vanda Sanderiana, but these are rare and extreme instances. Sometimes rich persons compete for a specimen which is unique and pay a price entirely out of line, simply to have something that another cannot get or perhaps sometimes to keep the other from getting it. The fact is that orchids are cheap, cheap in comparison with other plants which are so slow of propagation and must be drawn from distant sources and at considerable risk. Good plants of many of the most beautiful are now to be had at prices ranging from $1 to $2 50 or $3, mostly at or below $2, so that everyone who cultivates flowers under glass may enjoy a few orchids at least.

This country now boasts some grand collections, among which may be named those of Hon. Erastus Corning near Albany, of Wm. S. Kimball at Rochester, of Hon. F. L. Ames at North Easton, of H. H. Hunnewell at Wellesley and of Mr. Jay Gould at Irvington and several others. I have no doubt there are several hundreds of quite fair collections in the United States. In this city we have several collections of more or less impor-

tance, among which are those at Lincoln, Washington and the West Side parks and the private collections of Messrs. Anthony, Hobbs, Lane, Palmer, Williams, Dr. Clarke, Wittbold and Chadwick, eleven in all.

The Duke of Devonshire, attracted by the gorgeous butterfly orchid, the Oncidium Papilio of Trinidad, became interested in orchids and finally so enthusiastic about these fascinating flowers that the famous Chatsworth collection was the result. For many years the possession of orchids was the privilege of the few, as the first cost was very high and further was much increased by the great mortality which was the rule for many years.

Orchid flowers, however, being among the most beautiful and curious in nature, attract attention and kindle interest, through the singularity of their shapes, the richness and variety of their colors and the delicacy of their aromatic odors. Few orchid flowers are fugitive, but the vast majority of them are remarkably lasting even when cut from the plant, while many remain on the plants in full beauty for weeks and some for months. I have had a single stem of Odontoglossum maculatum stand in bloom for five consecutive months, perfect flowers all that time. But it is very detrimental to the future well being of the plant to permit flowers to remain on too long before cutting. The qualities mentioned have been incentive in encouraging their culture even when it was prosecuted at heavy expense and with many repeated disasters, hundreds of thousands of valuable plants having been lost in the early days of their introduction and attempted growth. They are now imported in large quantities, sold at low prices and they are had from many dealers with but little trouble and their management is so well understood that they may be, and are justly considered, a good investment. The flowers, once beyond the reach of all but the affluent, are sought and enjoyed by all flower lovers and their future is still before them. The number and importance of both private and trade collections have greatly increased and there are few greenhouses anywhere that do not boast more or less orchids.

The love of flowers seems to be generally on the increase with all classes and, indeed, horticulture has taken a position with the public within the past few decades never previously attained, and I take this to be one of the good signs of the times. How little place has horticulture had in past expositions of the world's progress and today we may safely say that in our approaching Columbian World's Fair horticulture will be an important and one of the brightest and most attractive features, excelling anything of the kind ever attempted heretofore. The great orchid shows held of late years in London, Paris, Brussels, Boston, New York and other large cities, with the attention and patronage they have commanded and the enthusiasm they have evoked, tell the story plainly—orchids have become popular. Not only is this true, but from their qualities, to which I have briefly alluded, they are destined to become even more so and I look to see them become as generally grown and known as other flowers.

In the early days of attempted orchid culture their management was not at all understood, for thousands of beautiful orchids were brought from their airy, breezy homes in the tropics only to swelter, stifle and languish under the smothering treatment to which they were subjected, finally dying—killed by mistaken kindness. After many years of repeated failure a more rational system was established as the result of some experiments made by an English gardener, and for the past fifteen or twenty years it has been recognized that an orchid, even if it does come from a tropic land, enjoys fresh air and cannot long thrive without it.

A variety of temperatures and climatic conditions exist within the tropics, well illustrated by the fact that while the words "tropics" and "tropical" naturally suggest great heat we may consider one orchid, Oncidium Nubigemum, which is found in many collections, flourishes in the mountains of New Grenada, almost under the equator, at an altitude of 14,000 feet, and under cultivation requires the very coolest treatment given any plant that is grown under glass; yet it comes from the tropics. The warm, moisture-laden air currents from the Pacific striking the cool peaks of the Andean chain, part with that moisture in such a way that portions of the depressed plateau behind the first or coast range are almost perpetually bathed with showers and mists and fogs, until the vegetation fairly drips; yet from its elevation the district is always cool. Here grow some of the most beautiful orchids, oncidiums of chiefly golden hue, odontoglossums, the admired of all observers, and many others, but the pure and delicate Odontoglossum crispum and Pescatorei merit any amount of eulogium.

On comparing the various conditions under which the beautiful epiphytal orchids thrive and self-propagate, one arrives at the conclusion that altitude as well as latitude, moisture as well as heat are essential in determining their distribution—orchids of one kind or another grow in all latitudes except the very coldest and the very dryest. Finding the gorgeous epiphytes, then, from the Andean heights to the jungles of Borneo, we should not attempt to bring every sort under one temperature and one rule of culture, although experience demonstrates that many species may be grown together in one greenhouse and give quite satisfactory results, even though they are brought together from widely different parts of the earth. But it should be always understood that some will require one course of treatment and others a different one.

By far the larger proportion of orchids grow naturally upon the branches of forest trees, their long roots becoming fastened to the bark, thus fixing the plants in position. The roots grow around and about the adjacent branches and trunk, or hang down, drawing their nourishment almost entirely from the humidity of the atmosphere. Sometimes, it is true, the roots find nourishment in the mosses and decayed leaves, etc., which collect in the crotches of trunks and branches, but this is far different from growing in the ground. Therefore moisture is a most important factor in their culture, indeed when in full growth they can hardly (in reason) have too much water given them, and many sorts do not enjoy very severe drying, even when they are in a state of rest, but it is a good general rule that when the growth of an orchid is completed the supply of water should be greatly reduced.

Many fine orchids grow naturally not only on the branches of trees, but upon the boles of trees and upon rocks, boulders and ledges, while several other sorts grow directly in the earth, like the vast majority of plants. Thus we have two sections of orchids, the one last mentioned growing in the earth, called Terrestrial orchids, and the one containing those which grow *upon* something, as a tree or rock, etc., called Epiphytal orchids.

The species of the latter class are most numerous and interesting and are often confounded with and by many are supposed to be parasites, but this is an error. No orchid is a parasite, as are the mistletoe, the dodder and other familiar examples, which live upon the sap of the unfortunate bosom friend upon whom they flourish. The orchid, often called the aristocrat of the floral kingdom, does not live upon the fruits of another's toil, but is self-sustained and self-reliant, making its living honestly, and if an aristocrat, it sets a good example to others of the aristocracy. Its needs must be supplied and when this is properly done complaint is seldom heard and still less frequently merited, for under such conditions the beautiful flowers are usually profuse and the plants increase rapidly in dimensions and value.

As the epiphytal orchids, of which I will first speak, are emphatically air plants and are often so called, the air must or should carry to them their food, so during their growing season the atmosphere of an orchid house is found to be loaded with moisture to as high a degree as is consistent with the liberal admission of fresh pure air, for without proper ventilation they cannot long thrive.

The orchids from the highlands of Mexico, the plateau of the Andes, the Organ mountains of Brazil and a few from the cooler parts of the eastern hemisphere are happy under cool treatment, therefore we give them a house, preferably running east and west, and grow in the north exposure the greater part of the beautiful family of odontoglossums, masdevallias, adas, sophronitis, some oncidiums and a few others, and in the southern exposure most of the Mexican lælias, some epidendrums, nanodes, Cœlogyne cristata and some cypripediums, brassias, lycastes and others, and during a part of the year some cool cattleyas, as pumila, dolosa, Walkeriana, Lælia Dayana, Restrepias, etc. This "cool house" could be divided longitudinally by a glass partition to great advantage, and I so recommend. During winter nights the temperature of this house is permitted to descend to 50° and on summer nights is kept not below 60° and as near that as possible.

Those orchids which naturally enjoy a somewhat warmer habitat, as the gorgeous cattleyas of Brazil, etc., demand more generous treatment and are accommodated in the "intermediate house," where the temperature accords with its title, ranging from 50° to 60° in winter and 60° to 70°, or as nearly as possible, in summer. Here are grown nearly all the cattleyas, many lælias, as elegans, purpurata, flava, harpophylla, superbiens, most miltonias, some odontoglossums, as grande, phalænopsis and Insleayi, all sobralias, some vandas and oncidiums, most cymbidiums, some epidendrums, many cypripediums and the like.

Many gorgeous things from lowlands of the tropics, the islands of Borneo, Java, the Malayan peninsular, the Phillippines, Madagascar, India, Oceanica, and a few from Africa and the western hemisphere need more warmth, which they find in the "East India house" or "stove," where the minimum temperature is 60° in winter nights, and from 65° to 70° in summer nights. Here we find a congenial home for such as the angræcums, many arides, deciduous calanthes, all of the warmer cypripediums, nearly all the large family of dendrobiums, all phalaenopsis, saccolabiums, and most vandas, a few

POND OF AQUATICS AT LINCOLN PARK, CHICAGO.

cattleyas—superba, Lawrenciana, etc., chysis, Miltonia Roezli, and the like.

These three houses furnish sufficient variety of temperature for orchid cultivation, and by judicious arrangement of the heating apparatus and of ventilators, the well-being of every generally admired exotic orchid may be assured. It is evident that with our hot summers, an almost vertical sun and a bright sky, it is at times quite out of the question to keep the temperature down to or even near the limits just named. Measures are therefore taken to shield the plants from the burning rays of the sun, otherwise they may be burned, badly disfigured or even destroyed; and shade is provided which will temper the sun's rays and yet admit light, so necessary to vegetation. The glass may be painted over with a wash of white lead, skimmed milk and turpentine, or blinds and curtains may be fitted to roll up and down outside the glass. For my cool-house I use an open-meshed fabric, linen scrim, rolling up on wooden rollers, so mounted that when the shades are down there is a space between them and the glass of about 10 inches, giving a circulation of air between shades and glass very beneficial. This plan can hardly be recommended too highly.

Insects are a great pest, and we have used many remedies, but find that Hughes' Fir-Tree Oil is excellent for scale, mealy bug, etc., while we keep clear of green-fly by a simple, but efficacious preventive, which I have found much better than the usual practice of fumigation. We get tobacco stems from cigar-makers, and put them in piles of say a bushel on the hot water pipes, then when closing up the houses at night we dampen the tobacco stems. I need not say more for these remedies than to invite an inspection of the houses. Have used the tobacco stems more than six years, and shall continue their use. We trap slugs with cabbage leaves, etc., and rid the houses of ship's cockroaches by free use of phosphorus paste. The floors of the houses should be of earth with walks provided in the paths, earth floors being far preferable to concrete or cement floors. I have tested both thoroughly.

Rainwater from the roof should be caught and stored in tanks for use, and should be kept at about the temperature of the house. While water is necessary to orchid growth, it may be made the instrument of their destruction; if it is allowed to drip on the plants from overhead, or if the roots are allowed to stand in it as when the drainage of a pot gets clogged, so the superfluous water cannot pass off. The rafters of the houses should be channelled so as to carry away the water, thus avoiding drip; they are now to be had of lumber dealers made in this manner.

In large collections a room should be provided for exhibiting the plants in bloom, as it is much more comfortable to so view them, and the flowers keep fresh much longer in cool and dry air. Such a room can be partitioned off from the cool-house.

It would consume too much of your time for me to go into the details of potting and mounting and basketing the plants, therefore I will say in short that for most epiphytal orchids, in either pots or baskets, we use potsherds for drainage and are liberal in their use, and give them very loose, open, well cleaned peat for their roots to work in, and in growing season they enjoy a couch of live sphagnum moss growing on top of the peat. I procure a most excellent article of both peat and moss of Messrs. Williams, of Batavia. We put vandas and ærides into potsherds alone, no peat, but always a topping off of sphagnum. Formerly using charcoal, I have discarded it of late almost altogether.

When growth is finished many sorts demand a season of marked repose, with diminished waterings, and in some cases water must be entirely withheld for a time; the temperature should then be lower. After the growth of our deciduous dendrobiums is finished and ripened, we take them from their growing quarters and at once put them into the coldest house and keep them on the dry side; there they stay until the flowering season is over and new growth commences, when they go back into the stove house. During the daytime the temperature of each orchid house should rise some 10° above the night temperature, thus according with natural conditions.

This season we have tried the experiment of growing some of our exotic orchids out of doors under an open arbor partially covered by a grape-vine, where we laid some boards on the ground, and spread on them a layer of live sphagnum, on which we placed the plants about the middle of June 1, where they remained until September 20. The plants included Cyp. insigne, which grew finely, and is now better budded than ever before—about half a dozen large specimen plants. Also Cœlogyne cristata, about half our collection; of these we selected only those plants which had flowered the poorest in the past. The bulbs formed are smaller than common, but each plant now shows about 25 flower spikes—an immense improvement. Also three varieties of epidendrum and some large plants of Isochilus coronatus, all of which have thriven finely. The experiment was gratifyingly successful.

Terrestrial orchids are those which naturally grow in the earth, and include the large and widely distributed cypripediums which are found in three out of four quarters of the globe, stretching from the American continent through Britain and northern Europe, through India and as far north as Japan. There are some immense collections of cypripediums in both England and America. Some cypripediums become epiphytal, however, under certain conditions, and grow on the branches of high trees, as Cyp. Lowii. Among the better exotic terrestrials are the delicately beautiful calanthes, sobralias, some cymbidiums, disas, thunias, habenarias, phajus, etc. They are usually grown in a mixture of peat, loam and leaf mould, and they are generally of easy culture.

I have been asked frequently what orchids I would recommend florists to grow for cut flowers. The first consideration is: Can I recommend them to grow any orchids whatever for cut flowers? The answer is, yes. The following are popular flowers, and furnish a good assortment, while the plants will grow in a common greenhouse, and will not cost more than $1 each for good trade plants. Of the cattleyas, Percivalliana, Trianæ, Gaskelliana, Mossiæ, Bowringiana; Odontoglossoms grande, Insleayi and Schlieperianum; Cœlogyne cristata; Oncidiums crispum, varicosum, leucochilum and tigrinum; more expensive but fine is Cypripedium Spicerianum, while the following are all better, but much more difficult to grow: Cattleyas gigas, Dowiana, aurea; Phalænopsis amabilis; Calanthes of the vestita type; Vanda sauvis; the cool odontoglossoms, as crispum, Pescatorei, etc.

I have attempted to sketch the outlines of my subject as well as I can in a short paper and in a common sense manner, for there has been too much mystery thrown about orchids and their treatment. Until my collection assumed considerable size I cultivated and managed my plants unaided, having had no previous experience, and I have been successful from the start with nearly every sort I undertook. Hence, I feel no compunction in recommending this beautiful family to any of you, and I hope many more will take up their cultivation.

Aquatics.

We present in this issue two views of the ponds of aquatics at Lincoln Park, Chicago, from photographs taken about the middle of September. The engraving on page 205 gives a view of a portion of one of the unheated ponds, which have naturally disposed margins and contain many of our own natives as well as exotic sorts. At the right is seen a clump of the "rice grass" (Zizania aquatica), while the large mass of foliage in front of it is Nymphæa marliacea chromatella, showing the tendency of the marliacea sorts to bunch. Near the bridge the foliage of Nymphæa alba can be seen and in the lower right hand corner is a tangled mass of Limnocharis Humboldtii, Limnathemum nymphæoides and Eichhornia crassipes major. Other nymphæas are seen at the left. Though the engraving is certainly an excellent one it gives but an imperfect impression of the beauty of the pond, for the planting of the margin is such that new beauties are discovered at every step and few if any are shown in the picture.

The engraving on page 207 gives a view of a portion of one of the heated ponds. Here the growth is more luxuriant, but the ponds are smaller and the surroundings less attractive. In the picture a few leaves of a Victoria regia are seen at the extreme right, while to the left of these and near the center is seen a large plant of Nymphæa Zanzibarensis. Still further to the left—where the label is seen—is a plant of N. odorata rosea and in the right of the foreground is N. Devoniensis. At the left, in the distance, is a group of Nelumbium speciosum. Across the walk from the further margin of the pond can be seen a bed of cannas and caladiums which is a type of numerous handsome foliage beds that find a place in the park.

We are indebted to Superintendent Pettigrew and Head-gardener Stromback, for the following details regarding the construction of these ponds:

After the excavation was made the sides and bottoms of the ponds—which are in sandy ground—were rendered water tight by puddling them with clay. Blue clay is the best for the purpose, but clay that will answer the purpose can generally be secured anywhere by digging deep enough. If the clay is hard it is softened a little with water and when in proper condition is cut into slices about four inches thick with a spade. These slices are laid on the sides and bottom of the pond, fitting as closely together as possible, so as to form a complete layer of clay over the whole surface. The edges of the slices are then tamped to make the basin absolutely water tight. If the clay is too hard to tamp easily and well it is softened with water, but it must be tamped hard so that no leaky places may be left. The pond should be so arranged that the water may be drawn off at will.

At Lincoln Park the nymphæas are planted in the ponds in boxes eight feet square and one foot deep. These boxes are placed in position in the pond and filled with a compost consisting of one part heavy soil, one part light soil and two parts well rotted cow manure, well mixed together. The nymphæa is then planted in the center of the box and the surface of the soil covered with 1½ to 2 inches of sand to keep the manure from floating to the surface of the water.

Nymphæa Devoniensis is propagated from the young tubers. Mr. Stromback gathers the young tubers when he cleans out the ponds in the fall and places them in layers of sand, slightly moist—just so they won't get the dry rot—and keeps in a temperature of about 60°. About the middle of January these tubers are planted in a sandy loam, in a seed pan, and placed in a water tank, where the water is maintained at a temperature of about 80° until the eyes start. When the shoots are four or five inches long and have formed roots, they are detached and potted in 3-inch pots and placed back in the tank. They are shifted into 4 and 5-inch pots as growth requires and are then soon ready for the pond.

Nymphæa dentata is raised from seed. The seed is sown thinly in seed pans containing sandy loam, about January 1, a little covering of sand over the seed. It is about the size of mustard seed or even smaller. The pans are placed in the water tank, with about four inches of water over the top of the pans, and the water maintained at a temperature of 75° or 80°. When the seed germinates the little plants present the appearance of fine grass. When they have two leaves developed the plants are potted singly into 2-inch pots or pricked out into pans and later placed in separate pots. They are shifted from 2-inch into larger pots as required. Dentata does not grow as fast as Devoniensis and will be in 3 to 4-inch pots at time for planting out in the ponds. The seed can also be sown in the summer as soon as ripened on the old plants, the little plants handled in the same way as the others and kept in a tank over winter. Such plants will be stronger than those sown in January. But after August has passed sowing should not be undertaken until January. When the seed is sown in July or early in August a small bulb will be formed by fall, which can be easily carried over winter and make a strong plant. When the seed is sown in summer the temperature of the water need not be so high as in winter; 65° is high enough to carry the little bulbs over winter—that is, until January, when they should be started up by giving a temperature of 75° or 80°.

The ponds illustrated already show the effects of cold nights and the first hard frost will bring the summer display to an end. But both Mr. Pettigrew and Mr. Stromback express the belief that the plants could be made to bloom up to the holidays if the ponds could be covered by glass and heated, and that florists could grow these aquatic beauties for cut flowers at a profit in the early winter months as well as in summer. For commercial work they suggest an eight-foot wide trench covered by a twelve-foot house, which would allow for a two foot walk on each side. Such a house should be started in April. Air should of course be given on all favorable occasions. For evening decorative work the night bloomers, N. dentata and N. Devoniensis, are most useful. Many of the day blooming kinds are mentioned in the article on page 102 of our issue for September 10.

The Best Method of Wholesaling Flowers.

[*Read before the Florists' Club of Philadelphia by Joseph Heacock, Oct. 6.*]

MR. PRESIDENT AND FELLOW MEMBERS OF THE FLORISTS' CLUB:

When asked a month ago to prepare a paper to be read this evening I could not find it in my heart to say no after spending so many pleasant evenings with you and having partaken of the fruits of others' labors in the same direction, but I must confess that it was with great doubts of my ability to say anything that would either entertain or instruct. But having consented, I have jotted down a few thoughts and I hope you will not be entirely disappointed.

"The best method of wholesaling flowers" is a subject that must interest us all. To the grower it is that method which will dispose of the product of his thought and labor with the least expenditure of

POND OF AQUATICS AT LINCOLN PARK, CHICAGO

time and for the most money. To the retailer it is that method which will furnish him what flowers he wants, when he wants them and for the least money.

I would not have you think that I believe the growers' and retailers' interests are not identical, for such is not the case. Whatever is to the interest of one is to the interest of the other.

But what is the best method? I feel like quoting the Frenchman who gave directions for killing fleas. "First catch your flea." First get your flowers; and in getting them you cannot use too much *method*. "It is hard to sell an old shoe"; it is also very hard to sell poor flowers. Therefore use all the methods that are known to the trade. Watch the one hundred and one things that need attention and when as a result of your patient thought and labor you find yourself in possession of really good flowers you will find that they are already more than half sold.

The first cut flowers that I grew were Peter Henderson carnations. I sent them to a commission man in this city. The returns were very low, 50 cents per hundred, with 15 per cent off for selling. Of course it did not pay, but I hoped that it would some day, and on the Saturday before Easter, which came that year on the 2nd of April, I sent in 800 fine flowers. I imagine that I hear the rustle yet that the Peter Hendersons used to have, I told the boy to ask what they were getting for them and when he returned he told me $2 per hundred. We only settled once a month, so that I had no return until the 1st of May. I felt sure that I had sold 800 carnations for $16 less commissions. But when I received the statement I had an eye-opener. I have it yet. It read:

800 carnations	$4.00
Commissions	.60
Balance	$3.40

I concluded that there must be some mistake. But he insisted that it was right and that was all he would allow. I had had enough, so I took my little basket and went from store to store and sold all the carnations that I brought in during May and June for 75 cents per hundred and kept the commission. And this method has been so satisfactory that I am carrying my *little* basket yet.

This covers my experience with consigning to the commission men, with the exception of occasionally leaving some flowers when I had a surplus, with Mr. Baker, but I have always been disappointed when we settled. Agreeably so, however, for he always gave me more money than I expected. I believe most of the flowers that come to Philadelphia are disposed of by taking them around from store to store.

In my own case arriving in the city at 7:40; entering a store with a good morning; opening the basket; "what can I do for you to-day"; "why, you may give me some La France." Hang it, they are in the bottom of the basket. The basket is unpacked. The counter is covered with what he does not want before I reach what he does. The basket is repacked and I go on to the next place. Again unpack the whole of the contents, for pack it as I will the retailers are generally perverse enough to want what is the hardest to get at, repeating the unpacking and packing at every place and damaging the flowers each time. I noticed this more particularly last winter. I was carrying some Mme. Hoste buds and though really good buds when I started, if I did not succeed in selling them early in the morning, but carried them over my whole route, they were not worth selling. With roses of firmer petals the injury was less perceptible, but I know that they were all injured to some extent.

By noon I have covered my usual route and have been at ten or a dozen places, offering in many instances what was not wanted and missing the sale of the same to those who did want it, if they had known where to find it. A morning has gone and not over one hour's actual work of selling has been done. The rest of the time has gone in bruising flowers and in hustling from place to place. And one morning to the grower is not all, but he loses over 300 of them each year. Do you imagine that the grower is the only one that loses?

How often is it that you have an order to get off early and you wish the man

that serves you was only here. "What can be keeping him? If we didn't need the buds he would have been here an hour ago. It's always the way." And when he does come his "crop is off." Or maybe he has sold them to some one else, not knowing that you needed them very badly, possibly not caring, or if he has them they may not be as good as you expected them to be. You have waited until it is so late that you cannot get others and are forced to use them, but feel badly about it, but not nearly so badly as you feel sometimes afterwards when you find that your good customer has stopped dealing with you.

I estimate that there is not less than a quarter of a million of dollars' worth of flowers sold annually in this city. The business has made immense strides; each year has seen a large addition to the area covered with glass. Probably none greater than the present one; and it is going to continue.

Philadelphia is a large city covering many square miles solidly built with homes containing over a million people, with an annual increase of about 40,000 to her population. A town of that size springing up in the west is thought to be a wonder. It is occurring here every year and we think nothing of it.

There are retail florists in every part of it and yet there is no place in this whole city where they can meet the growers and fill an unexpected order. Each grower is working on an independent line instead of being united and having our business concentrated.

I believe the time has arrived when we ought to have an exchange for the sale of flowers in the central part of the city convenient to the two great railroad depots, where each morning the growers could meet the retailers and quickly dispose of their flowers, and that it would be mutually advantageous.

I cannot imagine any way in which this club could be of more use to its members than by starting such a market and at the same time it could be made a source of considerable revenue to the club.

Seasonable Notes.

October always brings very changeable and varying weather, and the grower will need to watch them very carefully to keep the temperature of the houses somewhat regular, otherwise when a warm spell follows closely upon a cool one, weak soft growth will be the result, which means poorer chances of a good crop when shorter days come and roses are in greater demand. To guard against this it is necessary to keep the temperature as low as possible, consistent with keeping the plants healthy, during dull, cold weather, say as near 56° at night as possible; and when necessary to have a little fire heat to keep the dampness out of the houses, leave a little top air on all night, and give all the air possible by day. During cloudy weather give as little water as possible; as it is better to keep the soil a little on the dry side during such weather, rather than have them make soft growth by keeping them too moist, but lose no opportunity to syringe the plants overhead on all favorable occasions.

Keep all weeds and decaying leaves cleared off, as an accumulation of such only harbors insect pests which need great care to avoid at this season, as once they get a hold on the plants it is very hard to get rid of them again, particularly red spider. Wherever "green fly" shows itself, fumigating or vaporizing with tobacco must be attended to, but as soon as the buds are needed fumigating will then be dangerous, as it discolors the buds; but where tobacco juice can be vaporized it is much the simplest way of destroying these pests, and I have yet failed to find it injure the most delicate flower; but this can only be done where steam is available. Where it is not practicable to follow either of the above methods, covering the walks, etc., with stems should be resorted to, but this method is more expensive than the vaporizing and always gives the house an untidy appearance.

Also, watering will now need special attention; in fact, watering, in the general acceptation of the term, will hardly ever be needed at this season of the year. We have found for years that when we can give the plants a fair syringing (with a rose jet on the hose) overhead they very rarely need any other watering. Of course there will be spots in any house that will occasionally need more than other parts of the same house, but with a little care these can always be seen and the additional water given during the general syringing, without affecting the other parts of the house, and it is always advisable to do whatever syringing is necessary as early in the day as possible, so that all surplus moisture may get dried up before night, otherwise mildew will be sure to follow, and black spot also be sure to put in its appearance if a damp, close atmosphere is allowed to remain in the house for any length of time.

As soon as the weather gets cool enough to demand a steady fire heat every night, a thin mulching of well-decomposed cow or sheep manure (not more than half an inch) should be put on, covering all the soil; this will help to bring the young feeding roots to the surface and supply them with the food they like best, which, in turn, will produce good, strong shoots from which the finest buds can be cut during part of November and December.

Those who wish to grow "Papa Gontier" should remember that to retain the leaves on the plants they should never be allowed to become very dry; also, if fine, large buds are desired, the night temperature for this variety should from now on never exceed 55° at night; 52° to 54° will suit them better. W. F. Bennett and Meteor will, on the other hand, as a rule do better with an average temperature of 58° to 60°, but should have an abundance of air during the day, in fact, no rose will produce really fine buds without it.

Attend carefully to tying the plants up as they need it, otherwise there will be many crooked stems, which will be detrimental to the flower and lower the price in market. The most suitable way to do this must be a matter for each grower to decide for himself, as opinions differ so widely on this matter. Here we have found a number 6 wire cut the desired length and used as an ordinary stake, with a thin galvanized wire stretched near the top the full length of the house, to which the stakes are all tied, makes the most convenient, and at the same time the neatest way of tying and supporting the plants of any we have yet tried or seen. We buy our wire stakes all cut the desired length and straight, and find the cost, everything included, is not very much more than the ordinary stakes, either wood or bamboo, and they will last for years. Mr. John Reid, of Jersey City, has used them now two or three years, and is more in favor of them every year. JOHN N. MAY.

Another Rose Record.

A lot of over 15,000 salable roses cut during October, November and December, 1890, and January, February, March, April and May, 1891, eight months, gave the following number of buds cut from each plant of the kinds named during that time:

La France	16.7
Perle des Jardins	15.2
The Bride	5 3
Niphetos	12.
Duchess de Brabant	25.5
W. F. Bennett	16.3
American Beauty	13 3
Mme. Hoste	12.
C. Mermet	7.1
Duchess of Albany	8.2
Mme. Cusin	14.
Average	13 2

W. T. BELL.

Our Telephone.

"Hello, central! Connect us with the Botanic Garden at Washington."

"There they are. Go ahead."

"Hello! Is that Mr. Smith?"

"Yes."

"Good morning, Mr. Smith. We know you are a busy man, between housing your plants for the winter, answering questions about the Victoria regia and explaining the peculiarities of the 'Mother-in-law' plant by day and the rival claims of that horticultural society, and that Burns collection at night, the problem is how you find time to rest or sleep. But if you can spare a few moments to talk to the readers of the FLORIST, we shall be pleased to tell them what you have to say."

"Gladly. You refer to the 'mother-in-law' plant. Now, some people have been inclined to censure me for introducing and giving currency to these so called popular names in connection with plants, but we believe in them here, and the leading thinkers are with us. The scientific law of priority often saddles a beautiful thing with a very unpoetic or unpronounceable name. When a popular name can be invented that has some descriptive or other character relative to the history of the plant, I am very much in favor of it, providing it will take with the people. If not, it will soon die. But in all cases there must be no attempt to deceive.

"Yes, I believe in names for the people, plants for the people. There are certain plants which may be called 'people's plants.' They must be of easy culture, the range of territory in which they will do well must be wide, and they must have certain peculiarities of beauty or utility which will make them favorites with the common people.

"There are many plants which deserve to be better known by the people. I have in mind now the Grevillea robusta. There is a 'people's plant,' easy of culture indoors in winter, and most graceful bedded out in summer. Another, the Phyllanthus roseo-pictus, or 'painted leaf plant,' is beautiful as a summer bedder. Dichorisandra thyrsiflora for mixed beds on a back line is a good one. This plant does well planted out, has beauty both in foliage and flower.

ALOCASIA SANDERIANA.

"I can see from my window a number of beautiful clumps of Abelia floribunda, covered with dainty, sweet-scented white flowers, and it has been so all summer. This is an old plant, yet it is scarcely known. Still, it is not only valuable as a people's plant, but as a florists' plant as well. For using in delicate funeral or bridal work no jessamine or bouvardia can excel it; it is always in bloom, is perfectly hardy in Washington, and possibly hardy much farther north.

"Jatropha Manihot is a neglected subtropical plant. Its seeds lie in the ground here all winter, and germinate in the spring. Dug up and stored from the frost anywhere, tall plants of it can be kept over winter.

"Terminalia elegans and Leea coccinea are also two very fine plants for subtropical effects, with rich, glossy, aralia-like foliage.

"But best of all, don't forget to mention the Eichhornia crassipes, or Pontederia crassipes, sometimes called the 'water hyacinth.' Here is an aquatic plant which should have a place in every garden. It is cheap, of easy culture, and flowers continuously. It is essentially a 'people's plant.'

"And this city of Washington is the 'people's city.' The 'New Hub of the Universe,' with all due respect to the 'Old Hub.' When the national society meets here next summer we will show them our street trees, which are the pride of the city, and without which Washington in summer would be almost uninhabitable. This has been our great life work, and is a monument far more glorious than any tower of marble can ever be. We have three streets planted entirely with the Salisburia adiantifolia, or Ginkgo tree. According to Loudon this is the best of all town trees. We have found it entirely satisfactory. The trees are doing finely, and are now beginning to bear seed."

"Then, Mr. Smith, your motto seems to be, 'Peop e's plants, people's names, the people's city, and the people's poet,' don't it?"

"Amen! Amen!"

"Before closing we would like to call your attention to a note which has been going the rounds of the daily papers to the effect that a gentleman is cultivating callas extensively in Florida for the tubers, which are to be introduced as an article of food, and which are said to resemble somewhat the sweet potato when cooked. Do you know anything about it?"

"I have been looking that matter up, and Smith's 'Economic Botany,' of Kew, makes no mention of it, nor can I find it named anywhere as an edible root. As it belongs to a dangerous family, if you mention it in the FLORIST at all, I would do so with caution."

Alocasia Sanderiana.

This most gorgeous foliaged stove plant, a native of the Eastern Archipelago, was sent out by Mr. William Bull in 1884 and '85.

The magnificent specimen illustrated was grown by Geo. McWilliam, of Whitinsville, Mass. At the annual exhibition of the Mass. Horticultural Society last September it was awarded a richly deserved silver medal.

This plant grows well in a mixture of fibrous peat, sand and charcoal, but will grow better in fibrous loam, leaf mould and charcoal, in a warm stove with a winter temperature of 65°, rising 20° in summer. Treated kindly, with water the temperature of the house, it will thrive first rate and make a pleasing subject, but treated carelessly, with cold water from an ordinary hydrant, it will dwindle away and there will be nothing left but the pot and soil. D. ALLAN.

World's Fair Notes.

The latest feature devised by Mr. Thorpe is a huge rock-work under the central dome of the Horticultural Building, which will be in round figures 100x100 feet and 70 feet high. This will be naturally arranged in the form of a miniature mountain and will be clothed with the thousand and one plants that will there find a congenial home, including giant tree ferns and palms. A mountain stream will dash from rock to rock from summit to base, appearing and disappearing beneath the tropic foliage, and furnish moisture for the plants that will grow along its margin, and that will delight in such conditions.

Underneath this rockwork will be a cave 80x80 feet and 60 feet high, which will be brilliantly illuminated by electric light, and in which will be carried on some very interesting experiments as to the effect of the electric light on the growth of plants. The cave will be elaborately decorated with plants, and during the six months that the Fair is open the question as to whether electric light can be made to take the place of sunlight in the growth of plants will be definitely settled. The Chief of the Department of Electricity is very enthusiastic over the proposed experiments, and has promised Mr. Thorpe all the assistance in his power.

Mr. Thorpe also proposes to make a feature of roof gardening, and will utilize the roof around the central dome of the Horticultural Building to show elaborate examples. He proposes to in this way show to the people who live in large cities the opportunity for gardening on a small scale that is open to every householder.

Another feature that Mr. Thorpe is endeavoring to add is a display of the native flora of each state, and prospects for its accomplishment are now very favorable. Mr. Thorpe has enlisted the interest and aid of the Board of Lady Managers, and the ladies are quite enthusiastic over the project, Mrs. Potter Palmer, the president, especially so. The collection of the material is to be made through the Lady Managers of each state. This botanical division will be under the direction of Mr. H. H. Hindshaw, a well known botanist of Chicago.

Last Monday Mr. Thorpe received three boxes of tuberous begonia flowers from Mr. Thomas Griffin, of Westbury, L. I. They came through in excellent condition, and were a splendid lot of blooms. The single flowers, though all very large, had more substance than any others we have seen, and the range of color was remarkable. In one seedling —a large single pink flower—two of the petals had crinkled or frilled margins. Mr. Griffin proposes to make a display of blooming plants at the Exposition in '93.

WHAT IS the cost of running your establishment for a year? And how many square feet of bench room are there in your houses? Divide the cost of maintenance for a year by the number of square feet of bench room and you have the cost of maintenance per square foot. It is estimated that to be profitable each square foot of space should produce at least $1.00 during the year. Is your establishment doing this? If not, is all your stock returning you a profit, or is some making a loss for you without your knowledge? Find out by keeping an accurate record of the returns from each kind of stock you grow.

Seasonable Notes.

We are now nearing the time when the results of a year's labor are to be exemplified. I am anxious to record the issues of 1891. The nearer the time the greater the anxiety, and I know that many of my brethren realize the importance of what can and should be accomplished.

There is so much to be done between now and the time of the exhibitions that I can simply say, "Eternal vigilance" is the price of GOOD chrysanthemums. That means constant watching, not only by day, but by night. It has happened to me that a fat snail has climbed up to the very best flower and made his breakfast on it. The ordinary wood-louse has also very often been the means of causing me grief by biting off here and there a petal, thus destroying a year's work. Look out for insects. Be careful in watering. Don't be afraid to give plants liberal doses of manure water or other stimulant.

JOHN THORPE.

Chrysanthemums Around Boston.

The most promising lot of flowers in this vicinity is at Galvin Bros'., at Dorchester. Mr. Sam Coleman, formerly with C. J. Power, is in charge. He has two large houses filled with chrysanthemums, each plant grown to a single bloom. They are all planted out on benches and are in splendid condition, with fine, large foliage, and enormous buds just beginning to show color. It was said that when Mr. Coleman went to Dorchester that he would find that chrysanthemums would not grow there as they had done at Framingham, but he has proved the contrary. Among his most promising varieties are Ada Spaulding, Kioto, Mrs. L. Canning, Domination, and W. H. Lincoln.

Lawrence Cotter, at C. V. Whitten's, has his also planted on benches. He has labored under the disadvantage that his house was not ready till August, and his planting was very late in consequence. They look well, however, especially Rohallion and Mrs. Alpheus Hardy. Of the two new houses built for this establishment last summer by Lord and Burnham, one is filled entirely with chrysanthemums, and the other with Ulrich Brunner roses. The Brunners were planted in June, and are at present as handsome a lot of plants as can possibly be found.

Mr. William Edgar, at Waverly, has two large houses planted exclusively to chrysanthemums. There are a few of these on benches, but they are mostly in solid beds. Mr. Edgar grows three to five flowers to a plant. He propagates very early, and his plants are consequently very tall. They are in thriving condition, with clean foliage, and there will be an immense crop, probably the largest cut of any one establishment about Boston. At present (October 8) there is one bed of Mme. Le Croix in full bloom, from which he has been cutting during the past week for the Boston market. Other varieties that are looking well are Rohallion, Domination, President Hyde, E. G. Hill and Ada Spaulding.

At Mr. Walter Hunnewell's, Mr. Hatfield has a lot of beautiful exhibition plants, also a good many seedlings, with the crosses carefully kept and numbered.

At Mr. Arthur Hunnewell's, Mr. Cole has a magnificent show of plants, which are equal to the very best ever grown in this vicinity. They are from 3 to 5 feet high, and when tied out will average from 4 to 6 feet across.

Fred Palmer, at Brookline, has his plants all in pots, about 8-inch size. They average 8 to 10 flowers on each plant. These are not grown specially for exhibition purposes, but are a fine lot of marketable blooms.

Mr. W. H. Elliott, at Brighton, has 2,000 fine, bushy plants in 8 and 9-inch pots. These are such varieties as Gloriosum, Pres. Hyde, Lady Selbourne, Source d'Or, M. Boyer, W. H. Lincoln, and Fair Maid of Guernsey. They are intended for market plants, and are grown low and bushy, bearing after disbudding from 50 to 75 flowers. Mr. Elliott also has one house benched for late cut blooms from very late struck cuttings. These are quite low, but the warm weather has pushed them forward, and it is doubtful if they are much behind the average crop in blooming.

Mr. A. H. Fewkes, at Newton Highlands, plants his chrysanthemums in the ground. He planted them quite late this year, but they are looking well, and will show a good crop of marketable flowers, 3 or 4 to a stem. He has quite a number of seedlings that look very promising and also has sets of all the varieties disseminated this year. Some of these are showing up better than many of the finest established favorites.

E. A. Wood, at West Newton, has a bench of healthy plants grown one flower to a plant on the same plan as Mr. Coleman's and Mr. Cotter's. Also 400 in 6-inch pots grown to one flower also. Some of the early varieties are showing color, and they give promise of some good specimen flowers by exhibition time. Mr. Wood has all the new varieties that have been put on the market this year, and a batch of about 100 seedlings that are looking finely.

Mr. Fewkes and Mr. Wood have both done their cross-fertilizing very carefully, keeping a strict record of the parentage in all cases. Mr. Fewkes complains of the Rose Weevil, and the cut-worm seems to have been giving more or less trouble all around.

Notes on New Carnations.

It may seem a little early to say much about the newer varieties. It is not, however, too early to make notes as to the time the different varieties should be pinched for the last time when growing out doors. The final stopping of the following sorts was done about August 26. For some varieties this was about right, while for others it was too early, and again for others it was too late. Though I suppose it is better not to be too hasty in arriving at that conclusion.

The varieties which have not produced a flower yet are Fred Creighton and Beauty of Oxford. The former I know to be a good one when it does come, but of the latter I can say nothing, as I have not yet seen a flower.

Golden Gate bursts its calyx. It rarely showed that defect with me last year.

J. R. Freeman, a light crimson, promises well, being well set with buds. The flower is good both in size and form.

Louise Porsch has so far given me only one flower; this is lighter in color than Buttercup and not as good in form, but it seems healthy and promises well for a good crop.

In passing I must say that the Buttercup is an entire failure with me. I secured strong healthy plants from a grower who is very successful with it, but with me it is the sorriest looking object in the whole lot of carnations grown here. The few plants which held through the summer and were put into the greenhouse with the rest will have to be thrown out. This is only a repetition of my experience with the same variety five or six years ago.

Daybreak pleases me very much. The flower is of good form and substance and the color is a delicate salmon or flesh color. When it may be had in sufficient quantity I think it will please the flower buyers.

Nellie Lewis is disappointing. It bursts badly. Outside of that serious defect it seems to be a very promising sort. It is a strong and healthy grower, a profuse bloomer and the color is a delicate pink. The flower is striped with two shades of light pink. Lizzie McGowan promises well, the plants grew satisfactorily, are set with a good crop of buds and the flower is of good form, though with a tendency to recurve, which we must say is a defect in a carnation.

Creole is a fine large flower of a deep crimson color. The plants have grown well, are healthy and are set well with flower buds.

Welcome evidently belongs to the Century type. It is very much like it in habit, though the color of the flower is a few shades lighter, as seen here.

Hector: This promises to fulfill all the good things that have been said about it. It is a thrifty grower, evidently a free bloomer, and the flower is large, without any suggestion of coarseness and the color is a brilliant scarlet. Portia will have to look to her laurels.

Fred Dorner is a very large flower, but unfortunately a majority of its flowers split their calyx. It is a scarlet.

Nelly Bly is a salmon striped with bright scarlet. It is very much like Cæsar, but the flower is not quite so good, nor does it seem to have so stout a stem.

Grace Battles is the ideal pink in color, a dwarf grower, profuse and early bloomer. It is in full bloom now. I am advised to pinch every flower stem off. If there is such a thing as a variety being too floriferous I believe it may with truth be said of this one.

Angelus somewhat resembles May Queen in color, but it is a little lighter I think. It is a good grower.

Patti is after the style of Chester Pride, but the flower is larger and in every way better.

I have several other novelties on trial, but they have not yet flowered. I must therefore defer mention of them until some future time.

About the right time to stop pinching: Each variety must be studied, so as to determine that point for our own individual selves, and then compare notes.

In this way we may get some ideas as to whether locality, soil or season has anything to do with our crops. Now is a good time to examine each variety with note book in hand, and thereby establish a guide for future operations.

No doubt the classification of this popular flower will be taken up by the American Carnation Society, so that in descriptions a variety may be referred to as early, medium or late.

EDWIN LONSDALE.

New York.

At the meeting of the New York Florists' Club last Monday evening, the nominations of officers for the ensuing year were as follows: President, James Dean; vice-president, Theo. Roehrs; secretary; John Young; treasurer, C. B. Weathered, trustees, W. A. Manda, H. A. Siebrecht, Wm. Plumb, S. C. Nash, Julius Roehrs, Ernst Asmus.

From all directions comes the welcome news that the period of excessive glut on roses is past for the present. Prices have stiffened up materially, and stock is disposed of more readily. When the great crop of chrysanthemums comes in the rose market will undoubtedly feel the pressure, but until then prospects are good.

Chrysanthemums just now are at fancy figures. Anything fairly good in blooms goes readily at $25 per 100. Good blooms of Mme. Des Grange are to be had in limited quantity. October Beauty comes in clusters and sells well. Indications are that while there may be a larger quantity of chrysanthemums on the market than there was last year, yet gilt-edged stock will bring fully as high prices as ever. The Madison Square Garden show will fortunately come just at the time when the biggest glut will be on, and will be a potent factor in maintaining prices.

In carnations the demand is for longer stems. A year or two ago 6 to 8 inches was considered a good stem for a carnation. Now 18 inches is none too much. And unless they are exceptionally long, customers don't want them.

There is constant demand for cattleyas and when a certain promised invoice of the famous C. labiata arrives it will be a good chance for some enterprising orchid grower to invest in a profitable fall bloomer.

Mr. I. Forsterman is cutting some good blooms from a chrysanthemum which is a sport from October Beauty. In color it is a bronzy yellow. Mr. Forsterman has a 200-foot house of chrysanthemums which makes a most promising appearance. He has about 7,000 plants altogether, of which 1,200 are seedlings. One of his seedlings shows finely variegated foliage, which has held constant for a year.

A magnificent bench of Lady Emma carnations cannot be passed by. Mr. Forsterman says that this variety will bear fully one-half as much again in a crop as Portia. It is a very vigorous grower, with sturdy stems. The American Flag is still a favorite in the New York market.

Mr. Ernst Asmus has gone to Lake Megantic on a hunting expedition. Statements as to his intentions vary. It is said by some that he proposes to shoot all the deers in Canada, but others say he will be satisfied if he gets but a pair.

Preparations for the chrysanthemum show go on prosperously. From Mr. W. H. Vanderbilt and Mr. W. Bayard Cutting grand exhibits are promised. Mr. Plumb reports that applications for space are coming in faster each day, and that those intending to exhibit will do well not to delay too long before applying. Several very large exhibits of cacti are promised. Another interesting feature will be a plant potting competition, for which a premium of $100 is offered by Peter Henderson & Co.

Sales at the plant auction the past week have gone about the same as previous reports. Small stuff is not wanted. Large plants bring fair prices. Growers having small palms on hand will do well to hold on to them until spring. Young sold for the Philadelphia growers on October 6. He got good prices and the growers were well satisfied. To-day's sale was not so encouraging.

Mr. James H. Laing, of John Laing & Son, Forest Hill, London, sailed on Sunday, October 11, after a lengthened and most successful tour in the United States and Canada.

Mr. C. L. Doran, the Sixth avenue florist, not contented with the bowling facilities of the New York Florists' Club, is also president of another similar organization, the Acme Bowling Club.

Boston.

The regular monthly meeting of the Gardeners' and Florists' Club was held in the library room of Horticultural Hall on Tuesday evening, October 6.

President J. H. Morton presided, and the new secretary, Elijah A. Wood, filled his position, if not his chair, with becoming dignity. The retiring treasurer, Mr. P. Welch, made his final report, which was very encouraging, and passed over the books and money to his successor, Mr. F. W. Foster, after which he received a vote of thanks from the club, to which he responded briefly. A vote of thanks to the retiring secretary, Mr. J. J. Cunningham, was also passed. The report of the special committee, with resolutions on the death of Mr. W. S. McGregor, was read by Mr. W. J. Stewart. Mr. Sam Coleman reported for the committee on the disposition of the cup won by the bowling team at Toronto, recommending that it be bowled for by all members of the club who wish, on Wednesday afternoon, November 4, the trophy to become the personal property of the individual making the largest score. The recommendations of the committee were adopted. Elijah A. Wood read the report of the committee on annual dinner, and in accordance with the recommendations therein contained it was voted that the dinner take place at the Quincy House on the evening of Wednesday, November 4, which will be the second day of the chrysanthemum show and the same day as the bowling match. A new rule was made requiring the treasurer to read at every meeting all bills contracted during the month. The officers of the club were requested to seek a good investment for the funds now in the treasury, and make a report at the November meeting.

Robert Farquhar, M. H. Norton, P. Welch, and R. T. Lombard were appointed as a committee to procure a charter for the club.

Several new members were admitted and the organization starts in on a new year with most encouraging prospects.

Norton Bros. made a fine decoration at the Hotel Brunswick on the occasion of the Hill-Carney wedding on October 7. The suite of three rooms was superbly decorated with masses of foliage plants and festoons of roses and vines. In the reception room was a bower luxuriantly hung with pendent racemes of lapagerias and scarlet passion flowers. In the middle room the mantel was banked with rich orchids and anthurium flowers in all positions. The bride's bouquet was of Bride roses and the bridesmaids' of Catherine Mermet.

A suburban florist tells a good story of a wealthy lady who came to his place recently with a carriage and pair, and said she wished to arrange to have him make for her a standing column about 18 inches high. After getting him to name the price of the wire frame and moss, she produced a small box which she said contained flowers enough to do the job and proposed to pay him just for the frame, moss, and whatever labor it required to properly arrange the flowers which she had brought. The box contained the following: 5 asters, 2 sprays of feverfew, a dozen sweet peas, 1 white geranium, 6 sprays of partridge vine, 2 rose geranium leaves, and a few bits of heliotrope. The suburban florist declined the job!

Mr. Alfred Dimmock, representing Sander & Co., of England, arrived on October 4, per steamer Scythia, after a very rough passage.

J. Newman & Sons, of 51 Tremont street, have arranged to act as the Boston end of the new Telegraph Delivery Asociation.

Norton Bros. are cutting splendid Gontier buds outside, which are in color and substance far superior to any grown indoors. The rose has proved hardy with them, requiring scarcely any protection in winter.

Mr. J. H. McManus, who has been for many years foreman at Galvin Bros.' store, was married October 7.

Philadelphia.

The regular meeting of the Florists' Club held Tuesday evening, October 6th, was largely attended, and great interest was taken in the proceedings. The Club is increasing in membership rapidly, two new members being elected and five names were presented for action at the next meeting.

Robt. Craig, President, occupied the chair. The committee appointed to prepare designs for the club button exhibited several drawings. Those giving the rose prominence seemed to meet with favor; none was adopted, however, but the committee hope to have a perfect design at the next meeting.

John Leach and H. H. Becker were elected to membership, and G. Howard Schriver, John J. McLean, W. M. Eldridge, James Gibson, George Paulelin and Gustavus Gontram were placed in nomination.

As this was the annual meeting of the club the treasurer's report for the year was read and the finances of the club shown to be in excellent condition. The house committee also presented their report, which showed a healthy state of affairs, as after paying all expenses and buying a pool and billiard table, there was quite a sum turned into the treasury of the club. The auditing committee reported the accounts to be correct and especially commended the officers for the very careful manner in which the books were kept.

Some five dollars was reported to be to the credit of the club in the defunct Keystone Bank. At one time the treasurer kept the club's money in this institution; fortunately for the club, however, the bowling alley was finished a short time before the bank failed, and the money drawn out to pay for it, otherwise it might have lost all, as it is expected that

the depositors will get a very small percentage of their money returned.

A letter was received from Mr. John Thorpe thanking the club for basket of flowers, etc., sent him in Chicago.

The election of officers for the ensuing year then took place, and the following were elected: President, Robert Craig; Vice President, Chas. D. Ball; Treasurer, Thos. Cartledge; Secretary, Henry F. Michel. On taking the chair Mr. Craig made a neat speech accepting the office, and was followed in turn by the others elected.

Mr. Edwin Lonsdale was appointed to prepare an essay on the chrysanthemum to be read at the next meeting.

The president appointed the following gentlemen to serve on house committee for one year: John Westcott, chairman, George Craig, Chas. Kohlert, Geo. Watson and John Nesbit.

Jos. Heacock was now called upon and read an essay on best methods of wholesaling cut flowers. His paper was well received and referred to publication committee. In the discussion which followed Mr. Ely thought the idea of having an exchange or market where buyers and sellers could meet, an excellent one, and quite easy of adoption, as expenses of such a place would not be heavy and the trade greatly benefited. He spoke of markets in Washington, where quantities of flowers were sold. But Mr. Lonsdale here said that the florists of Washington were opposed to the market there, as it was run to catch the retail trade. He would like to see a wholesale market, but would like some other fellow to start it. Mr. Heacock thought that a market such as he proposed should be patronized by the trade only, and that the general public should not be served there, but would have to go to the stores, as they do now. Mr. Kift said that the market question was something of a chestnut, as it had been talked about over and over again ever since the club was organized, and the same conclusion had always been arrived at, namely, that it was the best way cut flowers could be handled wholesale; committees were appointed and added to and urged to do something, but nothing ever came of it, and the only reason he could offer to account for it was that the growers were afraid, and until they got their courage up there would never be a market. Mr. Watson thought the plan a good one, and Horticultural Hall the place to start it in. Mr. Robert Craig said that the large growers in New York were seriously considering some plan other than the one now generally in use for wholesaling their products. One large grower had $10,000 to invest, and it was likely that before long some radical changes would take place. Mr. Geiger thought that the growers only wanted a little encouragement and all would be well, while Mr. Westcott thought the market sure to come, but he could not say just how soon.

After the transaction of some routine business the meeting adjourned.

Cosmos to the right of us, cosmos to the left of us, cosmos in front of us, cosmos everywhere. Two years ago it was a novelty, now it can be bought by the cart load. The street fakirs have their trays piled up with it and it sells for a song.

Trade is picking up a little and valley has moved from 5 to 6 cents. Roses are about the same price as last week, but the quality is getting better. There are not enough American Beauties to go round.

The "mums" have not been heard from as yet; they rarely strike this market until the 15th and it is generally the 25th before they begin to get at all plenty.

Carnations are now plenty and sell well. There is a good variety of colors and the stems are long. They can still be had for $1 a hundred.

We have seen no challenge as yet, but it is generally understood that there is to be a couple of matches between the bowling teams of the New York and Philadelphia Florists' Clubs. There will be a trophy in the shape of a handsome flower vase which will be contributed by the two clubs. The captain of the Philadelphia team has been given power to make all arrangements and in a few days the dates and places for holding the matches will be decided on. The games will be rolled on strange alleys so as to place each club on an equal footing.

At a match between the Chumps and Champions on the club alleys October 8 all match records so far were broken. There were six men on each side and three games were rolled. The total scores were: Champions 2772, Chumps 2556, making an average for each Champion of 154 pins to a game and the Chumps 142. X.

Chicago.

The market took a decided turn last week. The latter part of the week stock of all kinds was really scarce, particularly good roses.

October set in with a perfect rush—in the matrimonial line; there never were so many weddings in society before in one week. This accounts in a measure for the heavy demand for flowers, but then the business in general is much improved and the prospects for a good season seem very bright.

Roses are improving in quality, Mermets in particular begin to show once more clean foliage and good color. Wootons too come better. This rose has been a disappointment so far; there were quantities brought into the market, but they were so small and poor that most of them found their way into the barrel. Gontier, the good old stand-by, is coming to the front again and often has to stand in the breach for something better in the line of red roses. Beauties are not at their best just now, but the demand for this rose is constantly increasing.

Carnations begin to show up better. This popular flower is used more and more extensively every year. Tidal Wave, Portia, Silver Spray, Grace Wilder and Buttercup are the principal varieties in bloom now, the latter (Buttercup) is very scarce and meets with ready sale at fully double the price of any other variety.

Outdoor stuff, such as dahlias, a few asters and gladioluses and some belated sweet peas, are still in the market, but cosmos of all out of door stuff seems to sell the best. This flower is growing to be quite a favorite with flower buyers; large quantities find a ready sale at fairly good prices.

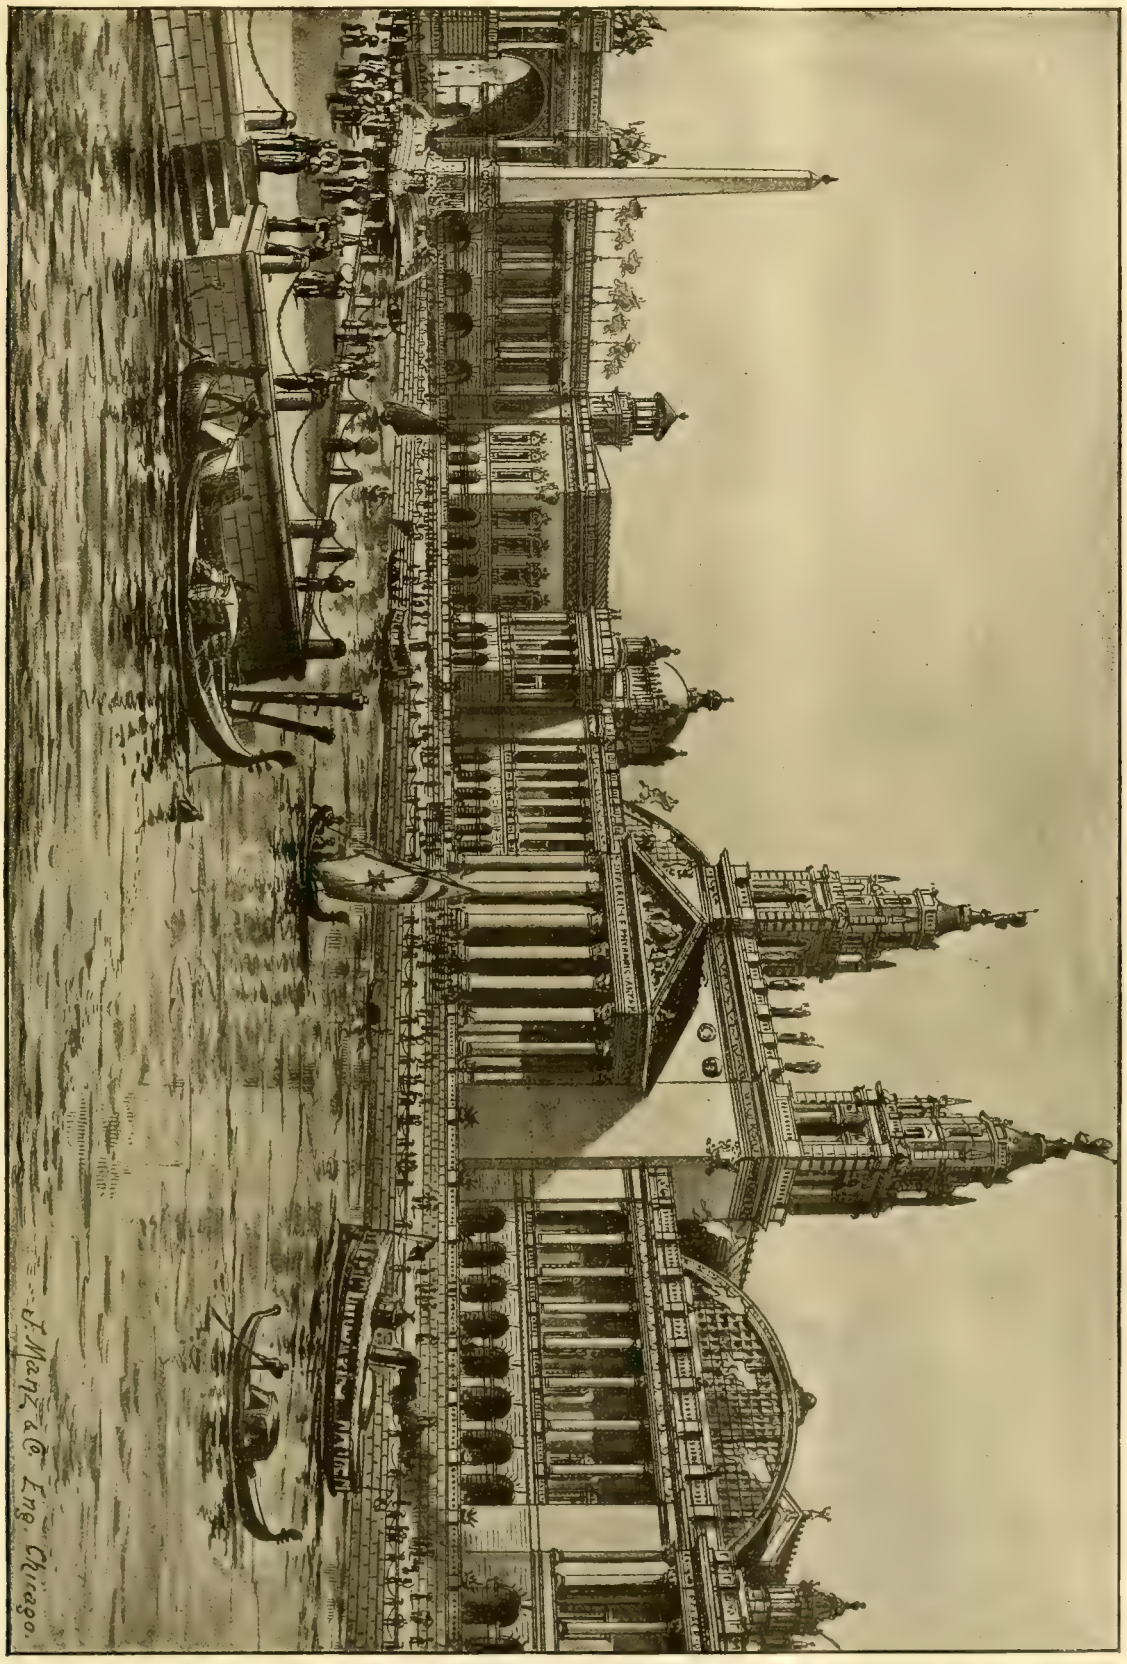
Chrysanthemums make their appearance here and there. A few blooms of Gloriosum sent in by Mr. Rudd, of Mt. Greenwood, were really fine. Bouvardia also is just coming in.

The extreme heat in the latter part of September has hurt the early crop of violets. There is very little prospect for any good flowers before the latter part of October or first of November.

The complete premium list for the fall exhibition of the Horticultural Society has been issued. A large number of valuable special premiums are offered in addition to the generous list announced in the advance sheet, making a total of $2,500. A sweepstakes premium of a silver tea service worth $75 is offered for the most meritorious display in the show, this to be decided by a popular vote, a coupon ballot to be attached to each of the admission tickets. It is believed that this feature will excite considerable interest. A popular vote on the national flower will also be taken, another coupon ballot being added to the ticket for this purpose. A committee has been appointed to label as many as possible of the plants on exhibition. These labels are to be of card board, about 2 by 4 inches, plainly printed or lettered and suspended from the plant in a horizontal position, so that they can be easily read from a short distance. It is believed that this will greatly enhance the educational value of the exhibition. A great many plants and flowers are being grown for the exhibition and the display promises to be very far in advance of anything of the kind yet seen in this city. Mr. Wm. H. Chadwick, the newly elected president of the Hort. Society, is making things hum and the business details of the exhibition are being attended to with gratifying promptness.

At the meeting of the Florist Club last Thursday evening little but routine business was accomplished, except discussion upon the question of judging at the coming exhibition. At the adjourned sessions Mr. A. McAdams raised his record several pegs by rolling up a score of 240. At the next meeting a paper upon the chrysanthemum will be read by Mr. Wm. Kirkham of Maywood.

There has been a slight change in the firm of Felke & Mueller, at Wilmette. Mr. John F. Felke, Jr., has sold his share in the business to John Felke, Sr., and Nicholas P. Mueller. As the change in ownership does not make any change in names the firm style of Felke & Mueller will be retained. The firm has added five more houses, four 18x106 each and one 12x58, three of them for carnations, one for Jacq roses and one for azaleas. This makes a total of 32,000 feet of glass for this firm. They are devoting some little attention to azaleas, and expect to have some very fine plants this season and in considerable quantities.



Mr. Geo. Klehm, of Arlington Heights, and Miss Louise Koelling were married last Thursday evening. The floral decorations were very elaborate and the wedding was attended by a large number of Mr. Klehm's friends in the trade, all of whom joined in extending hearty congratulations.

Mr. H. F. Halle has entirely remodeled his place on West Madison street, and it is now one of the handsomest and most convenient retail stores in the city. A conservatory in connection is a very taking feature, and the great show window gives splendid opportunity for the display of decorative plants, which is fully improved by this enterprising young florist, who has built up a splendid business in the last few years.

Among recent visitors to the city were Wm. B. Reed, Chambersburg, Pa.; J. Freytag, Milwaukee; F. B. Wenderoth, New York; A. Ingram, London, England; L. A. Perkins, Kinsman, O.; Button Bros., Lake Geneva, Wis.; J. R. Schrimshaw, Huntsville, Ala.

Machinery Hall at the World's Fair.

The main machinery building measures 850 by 500 feet. It is spanned by three arched trusses, and the interior will present the appearance of three railroad train-

MACHINERY HALL FOR THE WORLD'S COLUMBIAN EXPOSITION AT CHICAGO IN 1893

houses side by side, surrounded on all the four sides by a 50-foot gallery. In each of these three long naves there is to be an elevated traveling crane, running from end to end of the building. These will be useful in moving machinery, and when the Exposition opens platforms will be placed on them and visitors will view from these the entire exhibition at a great saving of tramping.

Shafting for power will be carried on the same posts which support these traveling bridges. Steam power will be used throughout this main building and this steam will be supplied from a main power house adjoining the south side of the building. The exterior towards the stock exhibit and the railroad is to be of the plainest description. On the two sides adjoining the grand court, the exterior will, however, be rich and palatial. All the buildings on this grand plazza are designed with a view to making an effective background for displays of every kind and in order to conform to the general richness of the court are enriched with colonnades and other architectural features.

The design follows classical models throughout, the detail being borrowed from the Rennaisance of Seville and other Spanish towns as being appropriate to a Columbian celebration.

A HINT TO EXHIBITORS.

Now that the time for exhibitions is on it is well to remember that exhibits of either plants or flowers are not only more interesting, but vastly more instructive to the public when correctly and legibly labelled. Next to seeing the flower itself the people want to know its name. The first question asked by an admirer of a plant or flower is sure to be, "what do you call it?"

Many exhibits, otherwise excellent, lose much of their value through having no names attached, or by having the names so poorly written or so inconveniently placed that they are almost unreadable. An ordinary wooden label stuck in the edge of the flower pot, while it answers every purpose in a greenhouse, is not convenient for the public in an exhibition. It can seldom be read without removing it, it is apt to be dirty and soil the hands, when in a group it is often impossible to reach it and if removed it is very likely to be put back in the wrong pot or placed so carelessly that it will drop out at a touch.

For cut flowers a neat and plainly written card placed in front of the vase with the edge of the vase resting on it just enough to keep it in place will do.

Scientific names are indispensable, but if there is a common name by which a plant is known do not fail to add it, and if the native locality of the plant is designated it will also add to its value. Try it and observe how interesting it will prove to your visitors.

SAN FRANCISCO.—The California State Floral Society announces the following special premiums to be awarded at the coming chrysanthemum show in addition to those already announced: For potted plants, chrysanthemums, $75; for cut blooms, chrysanthemums, $50; for "most artistic floral decoration according to the fancy of the exhibitor," 1st $75, 2nd $25. The exhibition will be held October 28, 29 and 30.

WE DESIRE to call the attention of the managers of exhibitions to the advertisement in this issue of Bunyard's exhibitor, for exhibiting chrysanthemums or other cut flowers to the best advantage. The device has received very favorable comment from those who have inspected it and anything that will add to the effectiveness of the displays at exhibitions is worthy of full consideration.

WHEN sending us small amounts in postage stamps, please select those of the 2-cent denomination.

Catalogues Received.

Charles D. Ball, Holmesburg, Philadelphia, palms, ferns and decorative plants; W. W. Barnard & Co., Chicago, bulbs, seeds, and plants; Thomas S. J., bulbs and seeds; same, stove and greenhouse plants; Emil Liebig, Dresden-Blasewitz, Germany, plants; Vilmorin, Andrieux & Co., Paris, France, electrotypes; Weeber & Don, New York, bulbs; Pike & Ellsworth, Jessamine, Fla., Florida flowers and fruits; V. H. Hallock & Son, Queens, N. Y., forcing bulbs; George L. Allen, Leigh, Neb., bulbs; Schlegel & Fottler, Boston, bulbs; F. Knoll, Leipzig-Lindenau, Germany, dried flowers, etc.

Bursting of the Calyx.

What is the cause of the bursting of the calyx?

My reason for asking this question is because sometimes a variety of carnation splits, and sometimes it does not. Two years ago the first flower of a seedling opened, and it was a veritable beauty, distinct and handsome in color, of fine form, and with no sign of the calyx bursting, and it remained in good shape for two weeks. About 25 young plants were raised, and in due time it was placed into its blooming quarters for the winter —last winter. When the first bloom opened the calyx was split, and I believe every flower produced up to the following June had this very serious defect. At this time, when the weather became hotter, the flowers had a less tendency to burst. Now, it puzzles me to account for this. Can some of your readers give a reason for it?

A new variety, sent out for the first time in the spring of '91, has produced a few flowers, and 90 per cent. of them are ruptured. It seems hardly possible that in this age, when we are slowly, but I hope surely, emerging from the darkness which has so long enveloped us, no live man would be guilty of disseminating a variety which he knew had a tendency to burst its calyx. Something in the season, or may be in the soil, caused it. Is it too much moisture? Have we kept them too cool? An interchange of opinions would be interesting to O. P. Q.

Classification of Chrysanthemums.

The classification of chrysanthemums having been placed in my hands by the National Chrysanthemum Society, I have associated with me Mr. A. H. Fewkes, and we would respectfully request the co-operation of, and solicit correspondence with, all chrysanthemum growers and anyone interested in the subject.

It is the intention of the committee to have all the information embodied in the report as authentic as possible. Any communications addressed to Mr. A. H. Fewkes, Newton Highlands, Mass., or myself will be thankfully received and promptly attended to.

ELIJAH A. WOOD.

West Newton, Mass.

Toronto.

October 9, and still there has been only a very slight frost, just enough only to catch the tips of the tenderest coleus. The record of the "oldest inhabitant" does not chronicle anything to equal this.

I mentioned in a former note that the Gardeners' and Florists' Club had adopted the one judge system for their coming chrysanthemum show. There was no difficulty about that; the trouble seems to be to get the one judge who will be suitable. Anyone who amounts to anything seems to have a show on in his own town about that time. However, it is hoped that before the next regular meeting Mr. Chambers, who has the matter in hand, will be able to submit the names of several gentlemen.

Trade very dull, on account of continued mild weather. E.

WHEN writing to advertisers please mention the fact that you were induced to write by the advertisement in the AMERICAN FLORIST. You will benefit us by letting advertisers know that it is the FLORIST that is bringing them trade.

DIRECTORY.
Every Florist, Nurseryman and Seedsman should have one.
AMERICAN FLORIST CO., Chicago.

The Seed Trade.

AM. SEED TRADE ASSOCIATION.

F. BARTELDES, Lawrence, Kan., president; A. L. DON, New York, secretary and treasurer. The tenth annual meeting at Hartford, Conn., second Tuesday in June, 1892. Applications for membership should be addressed to Wm. Meggatt, chairman membership committee, Wethersfield, Conn.

ONE MASSACHUSETTS grower has harvested 14,000 barrels of Danvers' Yellow onions this season. Not a surprising crop for some of our big western farmers, but pretty creditable for a little corner like Massachusetts, where agriculture was supposed to be on the decline.

THE Harnden Seed Co., of Kansas City, send us four samples of second growth peaches taken from a fruit farm at Olden, Mo. They write under date of October 7: "There are at present writing several hundred trees on this farm which have borne one crop this year and are now bearing a second crop. We thought it quite a novelty for Missouri." The specimens sent were perfect peaches in appearance except that the pit contained no germ and they were very small, not much larger than a hickory-nut. But the flavor was very good, rather nutty in character. They are certainly quite a novelty.

News Notes.

RACINE, WIS.—Florist F. Fountaine will give a chrysanthemum show the first week in November.

FAIRMONT, NEB.—John Rathbun is rebuilding and enlarging his greenhouses and arranging to heat by steam.

DOVER, N. H.—The greenhouses of Henry Johnson were burned October 6. Damage, $5,000; insurance, $4,000.

MEMPHIS, TENN.—Mr. Curry is the latest addition to the ranks of the trade here. He has opened up on Main street.

SALEM, MO.—The South Missouri Fruit Co. has been incorporated with a capital stock of $4,500, a part of the business to be the raising and selling of nursery stock.

MILFORD, MASS.—H. W. Eames & Co. have put in new machinery for the manufacturing of their "twin glazier points" on a large scale and will have the company incorporated.

PHILADELPHIA.—Messrs. Joseph H. and Charles H. Campbell, the retiring members of the old firm of J. H. Campbell & Sons, will engage in the nursery and seed business in southern California, and expect to leave for the west November 1.

ST. PAUL.—The St. Paul florists will hold their first annual chrysanthemum exhibition in November. The exact date will be announced later. L. G. Venzke, 131 East 6th street, is secretary. A. H. Bunde has opened a cut flower store at 24 and 26 Grand Arcade.

MINNEAPOLIS.—Mr. Gust. Malmquist and Miss Louise M. Erickson were married September 19. Among the many presents was a beautiful tea service set presented by the Society of Minnesota Florists, of which Mr. Malmquist has been a most able and efficient secretary for the past two years. Mr. M. has the best wishes of his brother florists.

SYRACUSE, N. Y.—Mr. G. Batholme, for the past eight years head gardener to Mrs. Theo. Dissel, has purchased land on Manlius street, near Woodlawn cemetery, and will start in the florist business and has commenced to build. He is a first-class florist, and has made a host of friends during his residence here and will have best wishes for his success.

MILWAUKEE, WIS.—The premium list for the first exhibition of the Wisconsin Florists' and Gardeners' Club has been issued, and copies may be had on application to the secretary, Mr. C. B. Whitnall, 438 Milwaukee street. The exhibition will be held in L. H. S. Armory, on Broadway, November 17 to 20. Of course chrysanthemum plants and cut flowers will be the main reliance, but premiums for roses and other flowers are offered.

PRESTON, ONT.—The annual exhibition of the Preston Hort. Society, held September 15 to 17, was very successful. In the classes for plants and cut flowers the principal takers of first premiums were as follows: In the plant classes, open to all, A. Common received 5 first premiums; Geo. Brown, Jno. Wells and H. L. Janzen, 2 each; A. Dunn, one. In the cut flower classes, open to all, of the first premiums, C. Probst received 11; H. L. Janzen, 8; H. Evers, 3; L. Koehler, Geo. Brown and A. Common, 2 each; C. Claflin and C. Bierman, 1 each.

SAN FRANCISCO.—The Florists' Club of California succeeded in having the city government impose a tax of $10 a quarter on all street peddlers and war has resulted. The bulk of the street peddlers of flowers here are Italians and they are hot blooded. They have held meetings for the purpose of considering means of getting even with the florists in some way, and threats of bodily harm have even been made. But the idea of any serious result is considered absurd and the police are vigorously enforcing the law and arresting any peddlers who have not paid the license fee.

SITUATIONS, WANTS, FOR SALE

Advertisements under this head will be inserted at the rate of 10 cents a line (seven words) each insertion. Cash must accompany order. Plant advs. not admitted under this head.

The Nursery Trade.

Census bulletin No. 109, giving a preliminary report prepared by Mr. J. H. Hale, special agent, upon the nursery industry of the United States, has been issued by the Census Bureau at Washington.

From the tabulations in this bulletin it appears that there are in the United States 4,510 nurseries, valued at $41,978,835.80 and occupying 172,806 acres of land, with an invested capital of $52,425,669.51, and giving employment to 45,657 men, 2,279 women and 14,200 animals, using in the propagation and cultivation of trees and plants $990,606.04 worth of implements. Of the acreage in nurseries 95,025.42 were found to be used in growing trees, plants, shrubs and vines of all ages; and the figures, based upon the best estimate of the nurserymen, make the grand total of plants and trees 3,386,855,778, of which 518,016,612 are fruit trees, 685,603,396 grape vines and small fruits, and the balance nut, deciduous and evergreen trees, hardy shrubs and roses. The largest acreage is devoted to the production of apple trees, viz.: 20,232,75 acres, numbering 240,570,666 young trees, giving an average of 11,890 per acre, while the plum, pear and peach have, respectively, 7,826.5, 6,854.25 and 3,357 acres, producing 88,494,367; 77,223,402 and 49,887,894 young trees, or an average of 11,307, 11,266 and 14,861 trees to the acre.

In number of nurseries, acreage and capital invested New York has a strong lead over the other states, she having 530 nurseries containing a total of 24,840 acres, representing a total invested capital of $12,202, 844.50. Illinois comes next in number of nurseries and acreage, having 434 nurseries, containing a total of 17,812 acres; followed closely by Ohio, Pennsylvania and Kansas, with numbers nearly as large.

In total capital invested, after New York comes California with an investment of $4,871,929.48 (though with a less acreage than several other states), then Illinois with $4,778,083.94; Pennsylvania with $4,210,805.50; Ohio with $4,178,518.19, and Missouri with $2,932,473.24. These are all who report an investment of over $2,000,000.

Mr. Hale has compiled a large number of tables of very great interest to the trade from the information secured, and a careful perusal will well repay every nurseryman in the country.

Choice Plants Cheap

JOHN H. LEY,

ANACOSTIA, WASHINGTON, D. C.,

V. H. HALLOCK & SON,

Queens, New York.

Indianapolis, Ind.

A very creditable display of plants and cut flowers was made at the recent state fair, by professionals as well as amateurs.

Mrs. Chas. Rieman carried off a good many first premiums on plants, taking 1st on caladiums, cannas, ferns, begonias, etc., also 2nd on bouquets, baskets, funeral designs, also 2nd on newest funeral design; Anthony Wiegand, 1st on palms, group of foliage plants and variegated plants; Bertermann Bros., 2nd on palms, group of foliage plants, cannas, ferns, etc., 1st funeral design, newest funeral design, newest show design, cut flowers, bouquets, baskets, gladiolus and roses, a clean sweep in this class; J. C. Vaughan, Chicago, 2nd on cut gladiolus; John Rieman & Co., 2nd on new show design, 3rd on new funeral design; Frank Saack, 2nd on cut flowers and roses; Chas. Wheatcraft, 1st on hanging baskets, 3rd on cut roses. There were four competitors in the amateur class. Mr. Henry Michel, of Marion, Ind., acted as expert judge.

Mr. G. C. Lange, at one time in business in this city, will start a floral store on Illinois street shortly. W. B.

Influence of Electric Light on the Growth of Plants.

The influence of the electric light on the growth of plants is discussed in the September 25 issue of *Science*, with allusions to Prof. L. H. Bailey's experiments at Cornell University Exp. Station. From this article it would appear his conclusions are not determinate of any positive benefit to plants from the light.

This summer some plants in my office windows have been doing well under the full blaze of a street lamp at the corner, about 75 feet distant. The windows have a north exposure, and get very little sunlight upon them, except by reflection from brick walls and windows on the opposite side of the street. The plants, however, get the benefit of a west wind, which is constantly blowing on them from the valley of the river. Cuttings and seedlings have made a very rapid growth. One ageratum 60 days from planting seed stands 18 inches high, with a full head of bloom. It is, however, delicate, and frequently its leaves wilt after a fall in the temperature of the air. From Sept. 16th to the 27th the temperature was 60° at 6 a. m. and 84° at noon. The seedling has had a full supply of water and fertilizer. As the air at 84° holds twice the amount of moisture it does at 60°, a fall of temperature occasioned a diminution of the supply of moisture to the leaves of the seedling, which soon wilted it. From this illustration I draw the inference that the hygrometer is a desirable instrument to have always in the greenhouse, as from it one may always tell the exact amount of moisture present in the atmosphere, and thus maintain the proper conditions for young plants and cuttings.

The electric light would have more influence upon plants at high temperatures than low temperatures, from the very fact of the difference in the moisture present, and it would seem probable that a variation of temperatures would determine by experiment what temperature is best for lights of a certain candle power. W. C.

Buffalo.

Trade received an impetus during the past few weeks. Some wedding decorations were called for, while the call for funeral flowers has been steady.

The supply of roses has been behind the demand, and carnations, which have been plenty, are now sought for. Dahlias have been fine and plenty, and many have been retailed at low prices

No frosts to speak of as yet, good weather prevailing of late. All tender stuff is practically under cover.

A fine Musa ensete on the lawn of an upper Main street resident has made a splendid show the past summer. The pot was sunk in the ground and sodded over. The leaves made a spread of over 12 feet across, and new ones succeeded the old ones as they became ragged from the wind, so a perfect growth was continually seen. The plant attracted much general attention from passers by. Though somewhat expensive to winter over, it would seem that the demand for such specimens would be good in any large city.

Soule & Son, of Hamburg, N. Y., displayed the small white chrysanthemum "Pequoit" in flower at the Erie county fair on September 22. They ascribed recent drouths as a probable cause for this earliness in flowering. Can't our hybridizers coax up a standard class to bloom thus early? It would fill a void between out door and indoor stuff in this locality, and at a season when there is good demand.

Walter Mott, of Philadephia, was the guest of some of the craft here this week.

F. B. Wenderoth, of New York City, read us "sermons" on baskets on Wednesday last.

J. H. Rebstock was East last week. It is currently reported that he bought so many palms that he can make a flower show alone and unaided.

The bell's of St. Luke's church chimed merrily on Wednesday, the 8th, when Wm. J. Palmer, Jr., led to the altar Miss Laura Mark, of this city. A reception was held at the home of the bride's parents.

Much interest and attention is now being given to the forthcoming chrysanthemum show to be held November 12th to 14th. All the details are in the hands of active committees, and the prospects are most encouraging for good results. It has been decided to charge 25 cents admission mornings and evenings, and 50 cents from 1 to 6 each afternoon. Active efforts are also being made to have everything positively ready at hour of opening, and encouraging special attendance on the afternoon of the opening day. An additional orchestra will be engaged for that afternoon, and all hands are expected to contribute in making it a gala occasion, and one that will give the show a good send-off. L. B. D.

HOW CAN I make the florists write about printing Catalogues NOW instead of in January? If they could see me weep big salty tears about those I *can't* do THEN, but which I could fairly jump on NOW for less money, may be they would have pity! I want to print Catalogues right away—I am hungry to do good Catalogues, better than ever, pretty, and all that. But in December and January I'll be stuck-up and proud, and probably won't care a darn for any more orders, 'cause I can't work more'n 27 hours a day. *Do* come along now—I am yearning for you! Drop a letter in the slot—J. Horace McFarland, Harrisburg, Pa.—and watch a Catalogue come flying back!

Washington.

Mr. W. R. Smith estimates the number of visitors to the aquatic display during the blooming of the Victoria regia at fully 40,000.

In the palm house at the Botanic Garden is a plant of Phœnix rupicola, which is supposed to be the largest specimen on the continent. It has been planted in the bed for the purpose of trying to obtain seed.

Out in the garden is a grand bed of azaleas, comprising not only the Ghent and other acknowledged hardy species, but also a large collection of the best named varieties of Indian azaleas, all of which have proved to be perfectly hardy here.

Mr. Smith is enthusiastically supported by his assistant, Mr. G. W. Oliver, in his efforts to popularize aquatic plants.

The sunflower is Mr. Smith's favorite candidate for "national flower." On a recent Sunday trip to Manassas, which your correspondent enjoyed with him, his eye for the beautiful rather got the best of him and he broke into enthusiastic praise of the golden rods along the roadside. Approaching the famous old battle-ground he grew retrospective, and looking out of the car window he exclaimed: "There! there's Bull Run! and do you see that bridge? Well, I once ran from that bridge all the way to Alexandria faster than you ever ran in your life."

London, Ont.

There was a good attendance at the regular meeting of the Florists' and Gardeners' Club on the 5th inst. After the admission of eight new members the principal business taken up was the consideration of a proposal to change the date of the chrysanthemum show. Owing to the continued hot weather chrysanthemums have made such rapid growth the change was considered necessary. And the fact that Thanksgiving day comes on the 5th made the change worthy of consideration. After an animated discussion it was decided to change the dates to November 3, 4, and 5.

There is an abundance of roses and carnations, with little or no demand.

Mr. Lem Cole will add two new houses, each 200x20, for growing tomatoes, making a total of 20,000 feet of glass devoted wholly to tomatoes.

George Rennie, at the Asylum for the Insane, has remodeled and enlarged one house, using drip bars, with 14x28 glass, iron supports and cement walks. G.

Transatlantic Wit

Lady S—— was a member of the D. B. P. A. (Dickey-Bird Protective Association). Early one morning she was strolling around her grounds in Ayrshire, when she happened to see an apprentice gardener throwing a stone at a robin that was picking up the worms from the newly turned up soil. "What do you mean by trying to hurt that poor bird?" said Lady S. Jimmy L., the apprentice, who knew that if he could not give a good answer he would be "sacked," promptly replied, "Please, your ladyship, the bird was a-trampin' doon ma diggin'."

Jimmy kept his place.

SOME FOLIAGE of a variegated Euphorbia heterophylla has been sent us by Mr. A. W. Smith, Americus, Ga. The leaves are broadly margined and blotched with creamy yellow and in the specimens sent the variegation is very marked.

EXCELSIOR STANDARD FLOWER POTS,

With Patent Ventilated and Perfect Drainage Bottom.

CARD. We beg leave to call your attention to our EXCELSIOR STANDARD POTS. You cannot well afford to be without them, as they are especially adapted for growing Chrysanthemums and all valuable plants.

FIRST CLASS CERTIFICATE OF MERIT AWARDED WHEREVER SHOWN.

We still carry in stock a full line of the regular "STANDARD" POTS.

When writing for price list state sizes and quantity wanted.

Price List sent on application to

AHEAD OF EVERYTHING.

We Follow None, Prize or No Prize.

Our latest improvements in machinery produce a Standard Pot which for lightness, smoothness and durability, has never been equaled. Customers buying of us will

SAVE ONE-THIRD IN FREIGHT.

And to prove this, we give below a table showing number in Crate and WEIGHT of same, which speaks for itself:

Size.	No. in Crate.	Weight.
1¾-inch	3,000	250 lbs.
2 "	2 400	250 "
2¼ "	1,750	250 "
2½ "	1,460	250 "
3 "	1,280	350 "
3½ "	800	350 "
4 "	600	350 "

It will be seen at a glance, that our pots are one-third lighter than formerly, and yet we claim that owing to the superior quality of our clay and improved machinery, they are stronger than any pot in the market, and we frankly ask you to make the test. ☞ SEND FOR PRICES.

Long Island Notes.

BY WM. FALCONER.

COSMOS may be too late for outdoor work in many parts of the country, but with us just now it is splendid outside—in fact, we regard it as indispensable; but to guard against accident in the way of early frost, we always grow some plants in pots to take indoors, if need be.

HELIOTROPE has bigger and finer trusses now than it had in summer, and it is always thus when the nights get long and cool. But the first breath of frost nips it.

TUBEROUS BEGONIAS are excellent for late summer and fall gardening, being continuously in bloom all the time, rain or shine, in the open or in the shade; but to see the blossoms in their utmost purity and loveliness you should now look upon the plants we lifted, potted, and brought indoors for seeding purposes a month or more ago; they are lovely! For cut flowers for shipping, however, they are of no use, but as pot plants in bloom, what have we now that is prettier?

ROSE GERANIUM.—At this time of the year, when flowers are getting scarce in the way of variety, big bunches of rose geranium, always a favorite, come in handy. And if you have a healthy patch of it outdoors, put a temporary frame and sashes over it, and some straw mats in frosty weather, and you can have it in good condition for a month or more yet. The rose geranium is also a capital window plant, and stout, stocky, healthy plants in 5-inch pots make pretty Christmas presents, and for church fairs they always are in demand.

JAPAN ANEMONES are among the loveliest late-blooming hardy perennials we have got, the white sort in particular. They are in their finest form in September and last through October. But dashing wind and rainstorms battering the flowers against each other and to the ground destroy them greatly. On the 12th and 13th of this month we had just such a storm with such an effect. Now if we had had a lot of these anemones in pots and in a cool greenhouse protected from wind and rain, we would have finer blossoms than we could get out of doors and without a blemish, and in quantity in proportion to the number of our plants, till the chrysanthemum season came in.

FOR LARGE hallway decorations, as a change from dahlias and cannas, we now are using large branches of glossy-leaved mahonia studded with late-flowered tritomas.

WHILE CALCEOLARIAS and Chinese primroses will bear a slight frost with seeming impunity, a cineraria, cool-house plant as it is, is as readily injured by frost as is a coleus or balsam; therefore if you still have them out in the cold frames, be very careful about them.

HARDY GLADIOLUS BULBS.—Sandersi and some other kinds of gladioluses are said to be hardy here—that is, to survive our winters in the ground out of doors; indeed, in the case of mixed varieties of gandavensis we often find that lots of them will come up in spring in ground that had been cropped with these gladioluses the previous year, rather emphasizing the plea of hardiness. But don't you rely upon this reputation for hardiness. Curious enough, small bulblets are far hardier in the moist ground than when lifted and dried. Be careful, therefore, that frost does not reach your gladiolus bulbs.

PEELING GLADIOLUS BULBLETS.—Named varieties of gladiolus bulblets are increased true to kind from bulblets only and not from seeds; division of the large corms, too, according to their eyes, is sometimes practiced, but so seldom that we need not now refer to it. Well, have you ever wondered why it is that these hard bulblets make such irregular and little growth the first year after planting? The truth is, their coating is too hard, tough and tight. Our large gladiolus growers peel their bulblets before planting them! This may appear incredible to many, but it is nevertheless a fact and the employes of these large nurseries not only peel bulblets by the dozen in winter, but also bring them home, and they and their families peel them at night by contract, thereby adding to their income. Peeled bulblets grow as much in one year as unpeeled ones grow in two years, and every one of them grows, which is not the case with unpeeled ones. Were it not for this system of peeling the bulblets to induce quick growth, hence quick multiplication, our florists could never get up stock enough of the choice popular kinds to supply the demand.

THE GOLDEN-LEAVED CHINESE PRIMROSE.—I have fine, big, stocky plants of it but every time I go around that way am almost constrained to throw them into the rubbish pile. It isn't a bright yellow like that of a golden bedder coleus at all, but a sickly greenish-yellow hue, whose very presence among a batch of plain green-leaved primroses gives an ill look to all of them.

DOUBLE-WHITE FEVERFEW, cut back end of July, are now in fine bloom again, and very acceptable they are, too, now when out-door blossoms are so scarce.

A CHRYSANTHEMUM SHOW at Flatbush, L. I.—At chrysanthemum time each year Mr. W. Brown opens his extensive gardens to the public, charging an admission fee of 50 cents. The ladies of his family take charge of the flower show, and all monies taken in this way are handed over to some charitable institution. And mark you, it is not after running expenses are paid the balance is given over to the charity. On the contrary, every penny taken is handed

over to the good cause. Last year the proceeds amounted to $1,402, and were given to the Brooklyn Home for Consumptives. This year the exhibition is to be held for the benefit of the building fund of the Home for Destitute Children of Brooklyn. At these exhibitions cut flowers and cake are sold to visitors, but the flowers as sold are cut there and then from the plants, and not brought in from other sources to be sold over again. Now, the question arises, what is the effect of a private show of this kind upon the business of the commercial florist? Let Mr. Gus Bennett, the head gardener, answer: "It increases the taste and desire for flowers. I know our people are more enthusiastic in the greenhouses and in the flowers than ever before, and I myself take a greater interest in them. And it does not interfere against the florist business in any way. Indeed, I know people who bought flowers here at our show that never before would spend a cent for flowers, and they now go to the dealers and get a few flowers for their table right along." And Mr. Bennett ought to know, for he himself was brought up in the commercial business, and a few rods distant his father's estate is running one of the principal trade places in Flatbush.

Useful Plants.

EURYA LATIFOLIA VAR.—Though by no means a new plant, the subject under consideration has not yet become a very common one, while its handsome foliage and good habit entitle it to a much more prominent place among available foliage plants for decorations. Eurya latifolia var. has also the additional merit of not requiring any great degree of heat in order to keep it in good condition, as it flourishes in a temperature of 45° to 55°. This plant is of shrubby habit and may be readily grown in pyramidal form if preferred, the leaves being somewhat similar to those of a camellia, but smaller in size and handsomely variegated with yellow, the tips of the shoots frequently being reddish. Propagation is not specially difficult and is effected by means of cuttings made from half-ripened shoots and kept moderately close for a time after they are put in, as when the cuttings are allowed to flag after putting in they do not readily recover. A light well drained soil is most suitable, and to induce stocky growth plenty of light should be given.

AUCUBA JAPONICA is another useful plant to the decorating florist and will stand much abuse without great injury, though it may be stated in passing that it hardly pays to try how much abuse a plant will stand. The aucubas also are very readily propagated and young plants will make good progress when planted out for the summer, and those not large enough for use the first winter may be heeled in in a warm frame in readiness for replanting the following season. Large plants of this species will of course be more effective in a decoration if they are well supplied with berries, the bright red of the latter adding much to the attractiveness of the plants, and in order to secure a good crop of berries it is best to secure a few plants of the male variety for the purpose of fertilization.

COPROSMA BAUERIANA VAR.—This is another rather old-fashioned plant, but a very pretty one, the ovate leaves of which are from one to two inches in length, glossy and dark green with an irregular border of yellowish white. Coprosma Baueriana var. is a hard-wooded shrub of moderate growth and is prettiest in a small state, one disadvantage being the fact that it is not one of the easiest plants to root, the cuttings having an unfortunate habit of damping off unless handled carefully. The most suitable wood for cuttings of the coprosma is found in short young growths, these being taken off with a heel and planted in a warm house, care being taken to keep the cuttings fresh without much watering.

PITTOSPORUM TOBIRA VAR. is a half-hardy shrub that might find more extended use among decorative stock, its leathery ovate leaves being more or less variegated with white, and while the variegation is not specially brilliant, yet the plant is neat in habit and attractive in appearance and is not greatly affected by sudden changes of temperature. Also propagated by cuttings, the latter being made from firm young shoots.

RHAPHIOLEPIS OVATA is still another half-hardy shrub that might prove its utility in the hands of a judicious decorator. It is rather dwarf in habit and not of extremely rapid growth, the leaves being broadly ovate in form and very dark green in color. The flowers of this shrub are quite pretty and produced in small clusters, the color varying from pure white to various shades of pink and are followed by black berries about the size of peas. In regard to soil this plant is not fastidious, almost any good light compost being suitable, and the propagation of rhaphiolepis is most easily accomplished from seeds which germinate readily and also make prettier plants than those from cuttings. Rhaphiolepis may also be kept in a frame, for a slight frost will do them no harm, the leaves being so tough and hard that they are not easily injured.

W. H. TAPLIN.

Holmesburg, Pa.

Seasonable Notes.

A few early kinds are now to be seen in Chicago of more than ordinary merit, but I regret to say even among these few varieties there are several wrongly labelled—for instance, I saw a few nice plants of M. E. Nichols labelled Mrs. Norman Davis. Now everybody should know that Mrs. N. Davis is a late incurved yellow Chinese. Then again I saw Harvest Queen labelled Mont Blanc. Mont Blanc is a very late variety.

About this time last year I advised the use of a blue lead pencil to O K all stock plants before being set aside for propagation. It is so little trouble to have with you a good descriptive catalogue for reference interleaved with blank paper to make notes on and to decide how many stock plants of each kind are to be kept. This applies to all growers, but more particularly to smaller growers who carry a list of 20 to 50 sorts.

According to reports chrysanthemums that were out of doors during the late hot spell are decidedly backward and many of the early kinds are not even showing color at this date, whereas those plants that have been under glass all the season are about in their normal condition. It would seem by this that to control chrysanthemums indoor cultivation is the best and safest method.

The interest in the "Queen" is even greater than last year and we hear daily of what is to be expected at the different exhibitions, and if half we hear proves true why then the carnival of 1891 will far eclipse any of its predecessors.

JOHN THORPE.

Nymphæa Sturtevantii.

This nymphæa originated with Mr. Sturtevant of Los Angeles, Cal., whose name it bears. In the Bartholdi fountain basin at the Botanic Garden in Washington during the past summer this grand lily has borne some immense blooms. The color of the flower is a bright rosy red but varies with the weather. This nymphæa is not a free bloomer as Nicholson states, but rather the reverse. It is a very robust grower having large leaves of a brownish metallic hue, quite distinct from any other species. About the end of February in order to secure a long season of bloom the bulbs of this variety should be started in water with a temperature of at least 60° F.; by the middle of May the plants will have attained a fair size, when they should be placed in their summer quarters. The soil should consist of loam and decomposed stable or cow manure in equal quantities. The crown of the plant when fixed for summer should be at least 18 inches beneath the surface of the water.

Vaporizing Tobacco for Killing Green-Fly, Etc.

For several years we have been treated to some articles relating to this subject. I have read all that have come within my notice with considerable interest, and have tried most of them in the manner advocated but failed to make a success of it till last winter. Having a power boiler here we attached a pipe to the same and run it through the shed connecting with each house as we passed through, putting two half inch valves with a nipple on each at about 50 feet apart in each of the houses. When green-fly shows itself we put about two and a half to three gallons of tobacco juice into two vessels—we use small tubs, placing one to each outlet—and when we have steam enough generated we turn it into the tubs through a short piece of steam hose having a jet of one quarter inch pipe fastened into the end. This carries the steam to the bottom of the vessel having the juice in, which quickly sets the whole to boiling. We put a hand full of stems into the tubs before turning on the steam, otherwise it would quickly boil over and defeat the object in view, it being required to boil quite rapidly to evaporate all the juice; it fills the house with a dense vapor, smelling more powerful than pleasant. This after various trials we find the simplest way of applying it, and generally two applications on two days following will destroy all the fly, and up to this writing I have not found the most delicate flower injured by it.

The most important part of the program of course is the juice and to get it of uniform strength, this of course before it is generally adopted will certainly be necessary, as, like all other things, it can very easily be overdone. If some of our manufacturers would make it cheap

NYMPHÆA STURTEVANTII

enough it would be a great saving to growers who can use it, as the bother of making it one's self would then be avoided and a uniform strength assured.

Some are using it in pans placed near a steam jet, by simply keeping a lot of stems in water, laying for some time before applying the steam. This method, while it may be made to answer the purpose very well, has some disadvantages, because the strength not being at all even it will be a little uncertain how much or how little to apply, besides often it is not advisable to have any more moisture than possible in the houses, and with a weak solution it would be necessary to evaporate a much larger quantity to get the desired amount of nicotine diffused through the houses.

Those having their houses heated with steam already can adopt this plan with

very small cost, and it certainly will give them a great deal of satisfaction, and, what is interesting to many, save considerable expense each year.

Summit, N. J. JOHN N. MAY.

Carnation Notes.

Early in September I had the pleasure of a day spent in part of that section of Chester county known as the "carnation belt." The day was all that could be desired, and my companion was that thorough artist and gentleman, Mr. H. H. Battles.

Mr. W. R. Shelmire's was the first place visited, which is located on the other side of the railroad track from the station at Avondale. Mr. Shelmire was busy getting in soil for his carnations. He spoke with confidence about his new one which he has named "Henry M. Stanley." It is a sport from Buttercup. In color and marking it is of the "Sunrise" type, but brighter. The most remarkable freak of nature that has ever come under my notice is that the blooms of this sport are fragrant, whereas the Buttercup, its parent, is not. Very few of Mr. Shelmire's carnations were in bloom. The running out of varieties was referred to during our conversation. Old La Purite was about the strongest grower he had among his whole collection.

Mr. Shelmire very thoughtfully telephoned to Mr. Charles T. Starr, who is located a mile or so out of the town. Mr. Starr shortly afterwards arrived with his carriage, when we had a very pleasant drive to his home.

Mr. Starr is favorably impressed with his seedling, W. F. Dreer. It is a healthy grower, and the flower is large and of good shape. The color is pink, lighter than Century—one of its parents—and darker than Grace Wilder. All his plants were in the best of health apparently, and he had about 30,000 planted out all told, 20,000 of which he uses in his own houses.

It was a noticeable fact that the plants were not nearly so large, either here or at any of the other places visited that day, as they are in and about the city of Philadelphia, *nor was the mortality so great.* The plants evidently do not grow as freely in the soil thereabouts as they do in the Quaker City. They have a sort of semi-ripened look. The soil is of an entirely different character, both in looks and in the absence or the presence of some ingredient which suits the carnation. The plants are set out in the field one foot apart each way, in direct straight lines; in this way they are quite conveniently cultivated both ways with a wheel hoe. Space is thereby economized and the plants have all the room needed.

We next visited Mr. William Swayne. We found him busy planting. Neither Mr. Starr nor Mr. Shelmire had commenced to plant. Mr. Swayne deplored the fact that Buttercup was losing vitality. It does not grow well outdoors any more. If the plants remained healthy outside in summer heretofore, they had done satisfactorily when taken inside, but he seemed doubtful about the plants on hand doing well. All his other varieties were in good condition.

Mr. Edward Swayne was our next victim. We found him also planting. He is quite proud of his seedling, which he has named Aurora. It is a pink variety, and it will, we hope, be heard of favorably the coming winter. There were no flowers open. The plants presented a very healthy, stocky appearance. Mr. Swayne informed us that last winter he cut nearly 200 flowers from one plant. That speaks well for its free-blooming qualities.

We were next taken another enjoyable drive, this time to meet and become acquainted with Mr. C. F. Pennock. Mr. Pennock has recently purchased the stock of the Mammoth Pearl, a new variety which promises to give large flowers on good long stems.

Mr. Pennock, and, indeed, all the Chester county carnation men, were enthusiastic about the American Carnation Society.

In conclusion, Mr. Battles and myself enjoyed ourselves immensely.

Philadelphia. EDWIN LONSDALE.

The American Carnation Society.

The American Carnation Society was organized very auspiciously in Philadelphia October 15 at Horticultural Hall. The meeting was called to order by Mr. C. F. Evans. About 50 names were placed on the roll of membership.

Officers were elected as follows: President, Edwin Lonsdale; Vice-President, William Swayne; Treasurer, C. W. Ward, E. Moriches, N. Y.; Secretary, C. J. Pennock, Kennett Square, Pa. Robert Craig, R. T. Lombard, Wayland, Mass., and James Hancock, Grand Haven, Mich., acting in conjunction with the elected officers constitute the executive committee.

Vice-presidents for the different sections were elected as follows: New England States, Benjamin Grey, Malden, Mass.; Middle States, William Scott, Buffalo, N. Y.; Southern States, Benjamin Durfee, Washington, D. C.; Western States, E. G. Hill, Richmond, Ind; Northwestern States, R. J. Mendenhall, Minneapolis, Minn.; Pacific States, C. J. Haettel, Redondo Beach, Los Angeles Co., Cal.; Canada, to be appointed.

The aims and objects of the society are to improve the carnation in every possible way. By encouragement to make displays of flowers of exceptional merit at all exhibitions—fall, spring and at the chrysanthemum shows.

It was proposed to hold an exhibition at some point where eastern and western growers of seedlings could conveniently send their flowers for examination, to be reported upon by competent judges. Pittsburg was named as being an excellent point for such a purpose.

It was also proposed that the executive committee appoint what should be known as the test committee, this to be composed of successful carnation growers located in different sections of the country. The vice-presidents might well be selected for this purpose, to whom, say at least three plants of any new variety be submitted for trial before dissemination, and for each member of the committee to send a written report to the secretary as to its behavior, who when all were received would lay them before the executive committee for final action. Certificates to be awarded according to merit. In this way it would be a difficult matter to get a poor variety on the market. This is one way to raise the standard higher.

The meeting adjourned to meet again during the week of the New York chrysanthemum show. If we are not mistaken Friday November 6 is the day set aside for the contest for a silver cup, value $25, for the best 12 flowers of any new variety not before exhibited. The day of meeting will be fixed shortly, which will be announced in due time.

Any person interested wishing to become a member can do so by sending in his name and address to the secretary, Mr. Pennock, or the treasurer, Mr. Ward, or to any of the other officers. The dues are $2 a year.

There was a fine collection of carnations at the meeting. Mr. Chitty had a dozen or more varieties, among which were beautiful Lizzie McGowans and Dawn. Everybody present expressed the opinion that they had never seen such fine blooms of this variety before. The regret is that it does not succeed more generally than it does. It certainly, as shown on this occasion, would command the admiration of all flower buyers. Tidal Wave was good, so also were Lamborn and Grace Wilder. The latter variety when seen at its best as it was here, is very hard to beat. Edward Swayne had his Aurora here; it is a light pink sort more delicate than Grace Wilder. This variety is not for sale yet. A. M. Herr, of Lancaster, brought Simmons' Daybreak, which attracted a great deal of favorable comment.

A committee was appointed to examine these flowers, but the meeting adjourned before they had completed their labors. The committee was composed of such practical handlers of flowers as John Westcott, Robert Kift and H. H. Battles, who will make an intelligent report and in due course it will appear in these columns.

Your reporter failed to make notes or he would have given a more extended notice than he is able to do under the circumstances. I remember seeing some fine seedlings of John McGowan's; and a crimson sport of Century. This was exhibited by C. Eisele.

Mr. Robert Craig started quite an interesting discussion on the question of soil best to use for carnations. Many cultivators claim that they had used the same soil year after year with excellent results, while others said that they have never yet dared to try the experiment. One member said that he had tried it once, but before the winter was over he wished he had not. The general opinion expressed was that there is no necessity to use fresh compost as is done for roses. Old rose soil, or rather soil which had been used for roses, was highly recommended by some as being really in better condition for carnations than the composted sods which is often used. Other interesting subjects were touched upon, and nearly every member present had something to say on one or more of the questions presented.

The young society shows lots of vitality and there is no doubt that it will effect an endless amount of good. We wish it success.

Victoria Regia.

The accompanying illustration shows a specimen of the Victoria regia in the conservatory of the Allegheny City Parks, with one leaf turned over so that the structure of the underside of the leaf may be seen. The ability of the leaves to uphold very material weights is explained when the strength of their framework is noted.

VICTORIA REGIA WITH A LEAF TURNED OVER TO SHOW STRUCTURE OF THE UNDER SIDE.

Aquatic Plants.

Mr. Wm. Tricker is one of the most enthusiastic and successful growers of aquatics in the vicinity of New York. The announcement that he was to read a paper on his favorite subject was no doubt one of the chief causes of the large number present at the October meeting of the New York Florists' Club.

Mr. Tricker first called attention to several vases of nymphæas which he had brought, stating that they were all of the night blooming kinds and apologizing for their size and appearance on account of the chilly weather, but the verdict of the audience was that they required no apology.

Continuing, he said that water lilies are essentially summer and early fall flowering plants. Near the middle of October is pretty late to look for good blooms, as the temperature is so low and the sunshine so much diminished. Pond lilies have always been great favorites. The youngsters search largely for them in the spring time and the peddlers in the street sell them in enormous quantities. With the exception of Boston there is no flower market where pond lilies are regularly quoted in the market reports. Here in New York to most people the fact that our pond lily is wild is against its adoption as a fashionable flower. But the moment you call it nymphæa instead of pond lily you elevate it and it no longer is too common.

The Cape Cod pink pond lily is the grandest of all our hardy aquatic acquisitions. There are other varieties of the Nymphæa odorata that are also well deserving and that only require to be known to be appreciated, such as odorata superba, o. carnea, o. sulphurea and others. These and also some European varieties are perfectly hardy and are the earliest flowering aquatics. Next in order are the nelumbiums. The Egyptian and Japanese species are the best of all. For cut flowers and as decorative plants for ponds and basins their gorgeous flowers and bold massive leaves are admirable. Later on come the Nymphæa Zanzibarensis in many varieties and the various night blooming kinds. The number of night flowering varieties is small, but valuable additions to the list may be expected. The height of their bloom comes in the latter part of August and September in this latitude.

Mr. Tricker called the attention of his audience to the elaborate use of aquatic plants at Newport and Chicago and their charming effectiveness as decorative plants at these places, also to the prominence given to them at the recent Horticultural Exhibition at Boston and reminded them that New York cannot afford, having lost the World's Fair, to also lose her reputation as the leading florists' market in the United States.

As to the value of aquatics to retail florists he said he could not speak practically. To grow nymphæas for the market he recommended that odorata varieties be planted in tanks with some arrangement to protect them from severe weather in early spring, and by this means the flowers could be obtained as early as April without artificial heat. Other kinds might be grown in tubs, but in tubs the night blooming kinds being naturally large growing varieties would be cramped for room and would throw much smaller leaves and flowers than where planted out. Planted out he has had some flowers measuring nearly a foot across. In a tank with a hot water pipe run through it and glass protection the time of flowering can be considerably prolonged. A tank two feet in depth will be sufficient. They should be planted in a compost of half soil and half rotten manure.

In answer to enquiries Mr. Tricker said that it was immaterial what kind of manure was used, only the richer the better.

Mr. Nash called his attention to Nelumbium luteum which he had omitted from his list. Mr. Tricker replied that the Japanese nelumbiums are very slow and very shy to flower, and that he would recommend N. speciosum as much the best.

New York.

The annual meeting for election of officers of the N. Y. Florists' Bowling Club was held on the afternoon of October 12. All the old officers were re-elected. The challenge from the bowling team of the Philadelphia Florist Club to meet them and compete for a trophy at the time of the chrysanthemum shows was accepted. Several new members were admitted, including some private gardeners who appear to be getting as deeply interested in the club as are the commercial men.

The meeting of the New York Florists' Club on the evening of October 12 was the largest and most enthusiastic they have had for many a day, and was a genuine surprise to those who have been aware of the slimness of some of the recent meetings. It was very amusing to see the astonished look on the faces of the late comers when they appeared at the door and saw the crowded condition of the hall. On the president's table were some vases of handsome night flowering nymphæas brought by Mr. Wm. Tricker, who was to read a paper on aquatic plants. The specimens shown included N. dentata, N. Devoniensis, N. rubra and N. Lotus. A beautiful collection of outdoor grown tuberous begonia flowers was shown by Mr. T. Griffin.

Mr. Jas. Dean read a report of progress on behalf of the committee on the coming Madison Square Garden Exhibition. He spoke in commendation of the efforts and earnestness of the Garden managers and predicted a success, the equal of which has never been seen in this country. Mr. Dean's report was supplemented by remarks by Mr. Wm. Plumb, who said that in his work as manager he had found everybody enthusiastic and ready to help, and urged the club collectively and individually to do all in their power to support the committee in their efforts. He was followed by Mr. J. N. May, who made remarks in a similar vein, and on motion of Mr. Cottam a vote of thanks was extended to the committee.

Mr. P. O'Mara, being called upon, explained the general terms of the proposed potting contest. There will probably be three prizes of $50, $30 and $20, and the competition will come off at stated hours on the afternoon and evening of each day during the exhibition. Charlie Weathered will provide the potting bench and Peter Henderson & Co. the pots and soil; 2-inch pots will be used.

The nomination of officers for the ensuing year being in order Messrs. Jas. Dean, W. A. Manda and J. H. Taylor were nominated for president. The two last named gentlemen withdrew their names in favor of Mr. Dean, who being called upon responded with a brief speech of thanks. Theodore Roehrs was named for vice-president amid great applause, and C. B. Weathered and John Young were re-nominated as treasurer and secretary respectively. For trustees two tickets were nominated, one containing the names of the old board and the other one Messrs. W. A. Manda, H. A. Siebrecht, W. Plumb, S. C. Nash, J. Roehrs and P. O'Mara (and not Mr. Asmus as given in last issue). The election will take place at the December meeting.

Mr. Wm. Tricker then read his paper on "Aquatic Plants," a synopsis of which will be found in another column. The essay was well received and was accorded a unanimous vote of thanks.

The names of eight applicants for membership who had been nominated at the previous meeting, were presented and

elected accordingly. Twelve more applications for membership were also handed in. Among the visitors present were R. C. Patterson, S. McClemens and J. W. Elliott, all of Pittsburg. Mr. Patterson, being called upon, made a few remarks in compliment to the enthusiastic meeting, and Mr. Elliott did likewise. After a few words from Pres. Burns expressing his pleasure at seeing so large an attendance and from President-elect Dean advising the chrysanthemum growers to keep their eye on the weather, the meeting adjourned.

The plant auctions still continue, but consignments of fine palms are growing less and the sales will soon be confined to dormant stock. A recent sale of Ficus elastica in various sizes was quite disappointing in its financial results. Pandanus utilis is getting scarce.

At the orchid house of Mr. Hicks Arnold there are several rare things in bloom now. Lælia Perrini alba, pure white, and L. Perrini nivea with white sepals and pink lip, are both in beautiful flower. Also a splendid variety of the old Cattleya labiata and Cypripedium reticulata. This cypripedium resembles C. longiflorum somewhat. The flowers are of a beautiful pea green color and are borne several on one stem.

Ed. Jansen says he will never publish any more catalogues for his "wicked competitors to steal cuts from!" His faithful little right bower, Wenderoth, has just got in from the west where he reports trade as being in a hopeful state.

D. H. Roberts will exhibit samples of his glass at the Madison Square Exhibition.

ON THE LONG ISLAND SIDE.

At I. Forstermann's there are some fine Mme. Des Grange chrysanthemums in bloom now, also October Beauty in quantity. Carnations are looking well here, especially a house of Lady Emma, which is quite popular in the cut flower market and brings 25c more per 100 than Portia. The Harrisii lilies are looking well and some of them will be in bloom by November 20. Mr. Forsterman is getting up quite a stock of Phrynium variegatum which he predicts has a bright future as a house decorative plant. Another fine plant which he asserts will be valuable for decorative purposes as soon as it is more plenty and cheaper is Dracæna Neo-Caledonica. Its foliage is very broad and massive. His Dracæna terminalis are particularly well colored. He claims that the bright color is mainly due to his method of always growing the plants on a hotbed in the greenhouse. He still has faith in the palm industry, and has 40,000 seed planted, mostly arecas and latanias. One would naturally look for orchids here also. They are to be seen suspended all along the roofs of the houses. Since they are expected to return a fair profit on their keeping they consist mainly of Cattleya Trianæ and look very healthy and promising.

ON THE JERSEY SIDE.

At Summit Mr. J. N. May is growing about his usual assortment for the winter trade, the only new things here in quantity being roses Waban and Madame Pierre Guillot. The latter Mr. May has great confidence in as a future standard cut flower market rose. The Waban has up to date proved somewhat disappointing very many of the buds coming one-sided, a peculiarity which no one seems to be able to explain satisfactorily. It shows also a strong tendency to mildew with Mr. May, being more affected at present with that trouble than any other rose on the place. A new rose now in its second year of blooming which Mr. May has considerable confidence in is a hybrid between American Beauty and Souv. d'un Ami. In color it is midway between its parents, the foliage is very heavy, the stem erect and strong. It is exceedingly floriferous, the buds being somewhat similar to those of the Bennett, but slightly more globular and in fragrance unsurpassed.

A peculiar feature in the American Beauty this season as noted by Mr. May is the tendency of the early growths to "go blind." He has never before had that trouble to such an extent so early in the year. This is one of the few places where the Bennett always does well. The soil seems to suit it, and in stem, foliage and bud it is all that could be desired.

Mr. May has a lot of good chrysanthemums which are beginning to show some fine specimen blooms. He finds a good many blind shoots on the Ada Spaulding.

At Pitcher & Manda's preparations are going on vigorously for their chrysanthemum exhibition which will be held at the greenhouses during the last week of October. The range of seven big new houses is filled completely with chrysanthemums. One house is full of specimen plants which will make of themselves a grand show. There are 2,500 of this year's seedlings, some of which are already in bloom and promise good results. All seedlings at this establishment are tried two years before being sent out. Of last year's lot there are a number of grand varieties, including Hicks Arnold, old gold, Miss Colegate, a pure white from Mrs. Hardy, Harry May, Mrs. W. S. Kimball, Dr. Mandeville, Mrs. E. D. Cutting and the Improved Mrs. Alpheus Hardy.

At Madison all the growers are going heavily into American Beauty. Scarcely a Perle is to be seen anywhere in the vicinity and it is a question where all the yellow roses required for the New York market this year are to come from. At T. J. Slaughter's there is a 300-foot house of American Beauty with Mme. Cusin along the front bench. Among the Cusins is one section of the "Climbing Cusin" which has achieved fame in Madison for the energy it displays in producing vigorous shoots 5 to 6 feet long without a sign of a flower and which is used by some of the growers to pay up old scores and get even with their competitors, to whom they sell it as the true Cusin. At Slaughter's as well as several other places upright galvanized iron wires have been adopted this year as a substitute for cane stakes with satisfactory results so far.

At W. H. Ryan's, Madison, the roses are looking finely, also at L. M. Noe's. In both these places the American Beauty seems to be the leading rose. Madame Cusin is showing unusually bright color all around, but it is said that it sells better in the cut flower market when not so dark.

Philadelphia.

Business is getting better; good flowers are scarce and prices are moving upwards. Gontiers are $2, Perles, Niphetos, Watteviles, Cusins, Hostes, Sunsets, and Bennetts $3, while Mermets, La France, Albanys and Brides bring from $4 to $5; valley is scarce at $6, carnations plenty at $1, long and short; cosmos in any quantity; no offer refused.

Among the palm growers trade is brisk. Florists generally throughout the country are getting necessary stock before the cold weather sets in. Mr. Charles Ball says that the past month had broken all records with him, and others in his line seem very much pleased with the way their stock has moved.

A great many azaleas have been imported this fall, and seem to have arrived in excellent condition. Spring flowering bulbs, too, are to be seen in quantities at all the large growers.

The American Carnation Society was born in Hort. Hall Thursday afternoon, October 15. It was a much heavier infant than the Society of American Florists, as that weighed less than a score of names at the time of the christening, while the carnation infant tipped the beam at 50 names. There were 35 gentlemen present, each of whom seemed very much in earnest, and letters of encouragement were received from florists in all parts of the country heartily indorsing the movement and desiring to have their names placed on the roll of membership. At least half of the gentlemen who were present make the carnation their specialty, and grow very little else.

Towards the close, after the business had been attended to, a general discussion took place, and many valuable hints were thrown out. The ideal carnation, it seems, is to be 4 inches in diameter, stems long and strong as a rose and very fragrant. Mr. Lonsdale said that to obtain large flowers raisers of new varieties should strive to get longer and broader petals rather than more of them, as they would then get larger flowers, which would not be so liable to burst. Quite a number said that they had imported varieties from Europe, but no good results were obtained, as they were all very late flowering and burst badly. The opinion was general that no help could be expected from this source, and that the carnation for America must be the product of the American grower.

There was quite a collection of blooms arranged on a table at the end of the room. We noticed a fine vase of Lamborn and another of Lizzie McGowan, and it was a toss of a copper as to which was the best. There were also some promising seedlings under numbers.

The "mums" have made their appearance. Becker had the first in pots, a pure white, said to be a sport from Mr. Davis or October Beauty, a pink variety. These were in October 12. R. Scott & Son were first with cut blooms, having fine Glorioosum and Fred Bergman on October 14. They will not have the market to themselves very long, however, as a visit among the growers shows the buds developing rapidly and many expect to cut fine blooms in a few days.

The plants being grown for the coming show look very promising; all agree that they will be finer this than last season, as the weather has been very favorable, and as great care has been taken in disbudding the flowers will be very large. We hear of some very fine seedlings—some wonders in pink and yellow.

The commissioners of Fairmount Park announced that the public might have the bedding plants that would be destroyed by frost if allowed to remain. On the days appointed it kept the entire force of gardeners busy digging up the plants, which were carried off by all sorts of people; the poor old woman with a basket which would hardly hold together jostled against the lady in silks who had her carriage in waiting. Everybody seemed happy, however, and no doubt many homes will be brightened whose owners could not have afforded to buy plants for them.

Charles E. Pennock died Friday afternoon, October 16, after a lingering illness

of consumption. He was about 35 years of age. His health has been failing so that about a year ago his brother Samuel was taken into the firm, and has conducted the business since that time. Mr. Pennock's first business venture was in New York, where he opened a retail store, but his health failing him he sold out to Wm. Scallen, who was then in his employ, and returned to Philadelphia, where he has since been engaged in the commission business.

Boston.

The Mass. Hort. Society has decided to hold the chrysanthemum show November 10 to 13—one week later than the time previously announced. The change was made at the request of the growers who thought they could make a better show a week later.

The cut flower trade has had a regular boom. Roses sell at sight, if good, regardless of variety. Carnations are scarce and are gobbled up as fast as they open. Lily of the valley also is in great demand. Chrysanthemums are coming in pretty lively and are in splendid quality. Specimen flowers are the rule. Cosmos is plenty. The home grown is much handsomer than that shipped from the south. Violets are coming in very slowly as yet, but the plants are looking well generally.

At Mr. John L. Gardner's at Brookline Cattleya Bowringiana is now flowering profusely. Among the new ones are two bearing flowers of unusually deep dark color.

One plant of C. Bowringiana at Mr. Gilmore's at North Easton has a spike carrying 21 blooms. We would like to know if any reader of the FLORIST has done it as well or better. In England 17 or 18 flowers to a spike is considered a remarkable thing.

Speaking of orchids, there is a very fine showing of flowers for the season at Mr. H. H. Hunnewell's conservatory. There is a magnificent spike of Saccolabium Blumei majus in bloom. Mr. Harris, by the way, has not got through telling about his Toronto trip. He can't understand how anybody can be anything but an Englishman and yet be truly happy.

Washington.

A goodly and prompt attendance marked the regular October meeting of the Florists' Club Tuesday night, the 6th inst.

After dispatching the routine business President Bowdler laid before us the present status of the flower market project. He stated that some days previously he had been invited by the president of the Board of Commissioners of the District of Columbia to a further conference on the subject. Commissioner Douglass appeared to desire to withdraw a former suggestion as to the triangular space at the junction of 7th street and Pennsylvania avenue, but thought another reservation near by at the southwest corner of 9th and Pennsylvania avenue known as Fountain Square might be obtained from Congress. He expressed the greatest interest in the subject and requested that the florists after inspection of this and any other sites they might think available would visit him again soon and confer further upon the question.

A lengthy and rather informal discussion followed, the smallness of Fountain Square being the only objection that could be urged, as there is no more central and prominent business locality in the city. Mention was made of a larger square—the Haymarket—a portion of which could undoubtedly be gotten easily, but its location is more obscure and present surroundings not of the most refined. Although the construction of our new million dollar postoffice will purify the neighborhood in time. The sentiment of the meeting seemed to be divided as to whether it is best to sacrifice space or eligibility of location. A committee was named to investigate both sites and wait upon the commissioners on the following day.

The next question of interest was the chrysanthemum show. Chairman Oliver of the executive committee reported that the outlook was not as bright as could be desired, but a discussion of the subject disclosed a pretty general belief that the demands for space would be more numerous and better defined when the growers shall have more time to figure out what they will have to exhibit.

There is one thing certain, our meetings have a better attendance than formerly and the interest shown in subjects discussed is very keen.

The Washington Evening *Star* of Oct. 7 contained the following:

A delegation of Washington florists, including Messrs. Bowdler, Field, Loose, Cadmus, Gude and Clark, had a hearing before the Commissioners this morning with reference to the building of a flower market.

The delegation stated that the space known as Fountain Square, at the southwest corner of Pennsylvania avenue and 9th street northwest, had been carefully examined with reference to its adaptability as a flower market and found it quite suitable for the purpose. A space sufficient to accommodate forty florists was found and altogether it was highly suitable for the needs of the florists.

Commissioner Douglass suggested that the delegation furnish the Commissioners with a design which would be not only useful, but ornamental. He was of the opinion that a building made of iron and glass would be acceptable. The florists will present a suitable plan in a few days.

C.

Toronto.

While reading some gems of poetry the other evening, I came across what I thought a gem of gems by Shelley, entitled, "To a Sensitive Plant," and I wondered if John Thorpe's little garden at the World's Fair would be anything like the garden described in this poem. I feel strongly tempted to copy the whole piece, but here are a couple of verses. (John Thorpe, S. F. W. F., will please take note:)

And the jessamine faint and the sweet tuberose,
The sweetest flower for scent that blows,
And all rare blossoms from every clime
Grew in that garden in perfect prime.

And the sinuous paths of lawn and of moss
Which led through the garden along and across,
Some open at once to the sun and the breeze,
Some lost among bowers of blossoming trees.

In another verse there is a description of the rose which some enterprising rose grower would do well to put on the outside cover of his catalogue along with the lithographic dainties.

The Gardeners' and Florists' regular meeting took place on the 14th, and being the night for nomination of officers, there was an extra large attendance. Chrysanthemum show business took up most of the time; owing to the club not having secured a judge for plants earlier in the year it finds it is now impossible to get a man to its entire liking, and in consequence has had to adopt another system, which I believe has been tried with success before, but is not at all common. Fifteen members of the club are chosen as judges; ten of these act on every entry, thus allowing those who may be exhibitors in any one entry to drop out; each man has a book with all the entries entered in it and each man judges the entry himself, putting three marks to the best, two to the second, and one to the third. The books are handed in to the secretary and totalled up, and of course the entry in each section that has the most marks takes the cake. In like manner judging by points may be done.

After the secretary gets the prize tickets out he will most probably need a little stimulant, and must be carefully attended to if he is likely to be wanted for further use.

The club has also another difficulty on hand. It, through one of its members, engaged the Hoit. Pavilion for November 10, 11 and 12. Some other society previously engaged it for Thanksgiving day (the date is not proclaimed until about a month before), and now it turns out that Thanksgiving day is to be on the 12th; ergo, the club has either got to give up that day or buy the other crowd out, which will cost $250. I think it probable that the latter course will be taken, but a special meeting has been called to decide the point.

E.

World's Fair Notes.

The ground plans for the distribution of plants in the front corridors of the Horticultural Hall have been designed by Chief Thorpe.

The south corridor is for tropical plants to be arranged in irregular groups, which will consist of orchids, palms, cycads, nepenthes, aroids, anthuriums, dracænas, crotons, marantas, etc.

The north corridor is for plants from more temperate zones, such as cacti, ferns, bamboos, etc., rock work, fountains and various tables for exhibits of begonias, lilies and other transitory plants. The size of each corridor is 170x68 feet.

The heating of the Horticultural Hall is now being considered and it is estimated that between 11 and 12 miles of 1¼-inch pipe will be required. The system will be steam and in all probability the fuel used will be oil.

An enthusiast from Utah would like to bring a good slice of the Rocky Mountains and drop it in front of the Horticultural Hall.

A communication from New Zealand proposing the use of numerous tree ferns in the decoration of the grounds and buildings has also been received.

"Christmas Greens"

BOUQUET GREEN.—Considerable of this stock has been bought from farmers who picked it during the hot September weather; it has been bought at 25 to 40 cents per 100 pounds higher than usual, and besides is now in poor shape. It will go to somebody later on. Green now coming in is all right, provided the farmer has already disposed of that first picked by him. The November prices depend entirely on the date of the first considerable snowstorms.

HOLLY.—Good stock well berried is almost sure to be scarce this year, in many sections the holly trees having no berries.

THE Bay County Horticultural Society of Bay City, Mich., offers some splendid premiums for best 100 blooms of chrysanthemums, 50 varieties, at its exhibition to be held November 5 to 11. The first premium is $150, second $50 and third $25. This is intended to draw fine flowers from a distance and local growers are excluded from competition. The society also offers to refund express charges on all flowers sent that are not awarded premiums.

News Notes.

FLORAL PARK, N. Y.—Julius Scharf has lost his oldest boy, a promising little lad of about 6 years.

DENVER, COLO.—During the month of September the Denver Flower Mission distributed 3,267 bouquets.

ST. LOUIS.—It is believed that Mr. D. S. Brown has the finest and most complete collection of nepenthes in the United States.

VICTORIA, B. C.—The gardeners and florists here are preparing to organize a club. There is a goodly number of the craft in this neighborhood.

CLEVELAND.—J. M. Gasser is putting up two new 100-foot rose houses at his Lake Avenue place. He is arranging to make a display of chrysanthemums Nov. 19, 20 and 21.

DETROIT.—The Detroit florists have announced a change of date for their chrysanthemum exhibition to one week later, owing to the backward condition of the flowers. The dates set are November 9 to 14.

PITTSBURGH, PA.—Robt. C. Patterson is preparing to enlarge his borders, he having leased the store adjoining his present quarters. With these two thrown into one he will have an ideal floral establishment.

SOUTH AMBOY, N. J.—At Geo. Such's there is a magnificent specimen of Nepenthes lanata. It is well furnished with beautiful pitchers and is probably the largest of its kind in this country. It attracts great admiration from visitors.

SAGINAW, MICH.—Florist Wm. Roethke will give an exhibition of chrysanthemums at Germania Hall, on Lapeer street, November 4 to 6. He has grown a lot of plants specially for this exhibition and will make an excellent display. The local press is quite enthusiastic over the coming event.

LAREDO, TEXAS.—Anna B. Nickels recently returned from a plant collecting trip in Mexico. She has built a new greenhouse 15x38 feet, which is covered with the plant-bed cloth instead of glass, and will report the result of the experiment next spring. She has had Mexican orchids in bloom for the past nine months.

DANVILLE, ILL.—The newly incorporated Maple Hill Floral and Nursery Co. has purchased ten acres of land and begun the erection of buildings. The officers for the first year are Chas. E. Olmsted, president; Wm. L. Runyan, vice-president; C. L. Lesley, treasurer; Grattan Hall, secretary; Albert C. Wasson, superintendent.

PITTSBURG.—The Florists' Club has got up a guarantee fund of $1,500 to insure against the possibilities of a deficiency in the receipts from the coming exhibition. It is hoped and expected there will be no deficiency, but it is considered safer to have such a fund to fall back upon in the event of unfavorable weather or other unforeseen circumstances.

NASHVILLE, TENN.—There will be an exhibition of chrysanthemums at the Broad Street Amusement Hall, November 10 to 14, the proceeds to go to the Davis Monument Association. The majority of the plants and flowers will be contributed by Mr. Crusman, of the Evergreen Lodge Gardens at Clarksville, and the display promises to be an excellent one.

PITTSTON, PA.—The Honesdale Improvement Association has resolved to plant tulips, hyacinths and crocus bulbs around the park fountain, and in the flower beds in other sections of the town. They further decided to co-operate with the citizens living along Riverside Park in filling in a corner near the bridge, laying out a walk along the lake, and otherwise beautifying that pretty spot.

HARTFORD, CONN.—Some time ago, President Atwood, of the Horticultural Society, sent in his resignation, and a special meeting was held recently to act upon it. It was decided not to accept the resignation, but to release Mr. Atwood from active service. The vice president, Capt. John W. Crane, will perform the duties of the chief office. Mr. Atwood is in poor health, and that was the only reason he had for the resignation.

FLATBUSH, N. Y.—At the conservatories of Mr. Wm. Brown, Melrose Park, a chrysanthemum show will be held from November 9 to 14 in aid of the building fund of the Home for Destitute Children. Mr. Gus Bennett is gardener here, which is a good guarantee that the exhibition will be a creditable one. Last year a similar venture by Mr. Brown netted the sum of $1,402 for the benefit of the Brooklyn Consumptives' Home.

NORRISTOWN, PA.—Mr. C. W. Bergner, a wealthy amateur, is building an elaborate range of conservatories and greenhouses at his country residence, "Abendrub," at Ambler. Hitchings & Co., of New York, are doing the work on contract and the price is said to be $15,000. Mr. Bergner has recently added to his property, and he now has 66 acres, all of which is being improved, and will be in time one of the handsomest places in this section.

NEW BRITAIN, CONN.—The dahlia show of the Horticultural Society, held October 1, was very successful. Nearly 100 varieties were shown, and as one exhibitor remarked, "Of every color except blue and black." At the meeting held during the exhibition a very interesting paper on the dahlia was read by Mr. J. L. Case, and the reading was followed by a very full discussion. At the next meeting, November 3, a paper on chrysanthemums will be read by Mr. Clark Hines.

CINCINNATI.—The monthly meeting of the Cincinnati Florists' Society was held Saturday evening, October 10. There was a fair attendance and four new members were added to the roll. Business is very good. Chrysanthemums are coming in, Gloriosum and Jessica being the most prominent, and the blooms are exceptionally fine and sell rapidly. American Beauty roses are also fine and meet with ready sale. Other stocks are good too, but demand far in excess of supply at present.

SYRACUSE, N. Y.—The date for holding the chrysanthemum show has been changed to November 12 and 13. The society found it necessary to do this as a local charity are to hold an entertainment on the same dates as the society had first determined upon. The show will be the finest ever held here. The premium list has been enlarged and is published, copies may be had by applying to the secretary. At the last monthly meeting the secretary was presented with a handsome present in recognition of services rendered to the society.

FREDERICK, MD.—Arrangements are being made for the holding of a grand flower show in this city about the second week in November. It is expected to hold the exhibition in the large building of Messrs. Birely Bros., East Patrick street. Everybody will be invited to bring flowers and help make the affair a success. No charge will be made for entries or admission. If this first effort proves a success the exhibition will be held annually. Those taking the first steps in the movement are Dr. William H. Baltzell, Messrs. Harry C. Keefer, C. E. Kemp, L. E. Mullinix, R. R. and R. A. Kemp and others.

MINNEAPOLIS, MINN.—The committee of arrangements for the chrysanthemum show has been very busy of late getting ready for the exhibition. In addition to the $1,000 offered by the club the committee has secured the promise of special premiums amounting to about $200. There is every indication that this year's show will far surpass that of last year. The florists are all well prepared for it and plants are in fine condition. The committee of arrangements consists of Messrs. E. Nagel, C. A. Smith and Wyman Elliot. The two large halls on the ground floor in the N. Y. Life building have been secured for the show.

SUMMIT, N. J.—The meeting of the New Jersey Social Florist Club, October 8, was one of the best held this fall. Mr. John N. May, the president, occupied the chair, and the club room was well filled. After the usual business was transacted a paper was read by Mr. H. Clinkaberry on the culture of the erica, which was received with much interest, this being a genus of plants rarely seen in vigorous health in this country. He suggested many important hints which if adopted would probably lead to more successful results in the future. After some discussion the meeting adjourned for bowling, which lasted until a late hour. Many good scores were made, and strikes and spares were numerous.

GALT, ONT.—The Galt Hort. Society's exhibition of September 2–3 was a complete success, both financially and in number of exhibits, and the society may well feel proud of their first effort. The hall was completely filled with a superb collection of plants and flowers which made a grand display. Fruit, however, did not show up quite so well, but this may be accounted for by the fact that apples, pears and outdoor grapes were not sufficiently advanced for exhibition purposes. The show for a first attempt may be put down as a complete success. The display of ferns was beautiful and much admired by visitors. Also the Rex and flowering begonias and the competition by exhibitors of the tuberous rooted begonias was very keen. The popularity of this section of begonias for exhibition purposes, both double and single, is growing. Many of the single ones were magnificently large, some of them measuring from 5 to 6 inches in diameter.

THE premium list of the Minneapolis Florists' Club for their third annual chrysanthemum exhibition has been issued and copies may be had from the secretary, Mr. E. Nagel, 1116 West Lake street, Minneapolis, Minn. The exhibition will be held November 10 to 13. The list of premiums is very liberal.

WHEN sending out premium lists, mail copies to the secretaries of other organizations giving exhibitions. Each organization should have the benefit of the ideas of all the others. See addresses of secretaries in our list of coming exhibitions.

Cultural Notes.

For epiphytal orchids grown in baskets and in pots I have found the employment of an open rather coarse peat to be very advantageous, admitting of copious watering when desirable, the excess passing off rapidly and permitting the access of air to the roots, a great desideratum.

The pots should be well drained with potsherds to two-thirds their depth, then putting in the peat and building it above the top of the pot in a sightly mound, the orchid being firmly fixed on top of the peat. During the growing season most orchids are benefitted by growing a layer of coarse short sphagnum or hypnum on the peat, especially the odontoglossums and similar plants.

For some classes, as the ærides, vandas and such, I prefer to use no peat whatever, simply crocks topping off with live sphagnum.

When growth is finished many demand a season of marked repose, the watering diminished (and with some almost withheld) and a cooler temperature; this is notably the case with nearly every deciduous dendrobium, chysis, etc.

I have found it beneficial to grow many orchids in baskets suspended from the rafters where they get full light, but in summer more or less shaded from the burning rays of the sun; but from inconvenience in watering have generally discarded blocks excepting where demanded in special cases and for establishing some newly imported plants. When imported plants are so treated we frequently plunge the block in a wood basket after the plant is established.

In repotting and remounting we cut away all dead roots, but carefully preserve every live root, and usually do all such work just before the plant starts to grow and never give water directly to those freshly potted until new roots are well started.

There is much risk in watering some sorts too freely before the new growth is sufficiently advanced, and with most cattleyas we water most sparingly until the new growth is two inches or more in length. WM. H. CHADWICK.

Chicago.

Insects and Diseases.

Conducted by CHARLES F. BAKER, Agricultural College P. O., Ingham Co., Mich.
Send specimens of unidentified insects and diseased plants to him at above address.

The Hollyhock Bug.

Last year and this our hollyhocks were attacked by a green bug, *Orthotylus (Psallus) delicatus*, Uhl. We find this attacks the hollyhocks worse than any other plant, though we find it also on the common mallow. We therefore call it the hollyhock bug.

As we do not know of any description of this bug in any bulletins, reports, or accessible treatises on economic insects, we give the following description of the imago (Fig. 1): Color bright green; head yellowish, triangular, broad; eyes globular, yellowish, with a dark center; antennæ nearly as long as the body, four-jointed, hairy, yellowish at base becoming dusky towards the last joint which is nearly black; hairs on first two joints dark, on last two light; first joint heavy, short and black at base; second four times as long as first, third two-thirds as long as second, fourth one-half as long as third; all but first joint slender. Rostrum (Fig. 1 a) or beak yellowish; four joints; reaches to middle legs; first joint robust, the remaining three slender, the last one longest and black except at base. Pronotum—upper part just back of head trapezoidal, widest behind, yellowish varying to green. The posterior two-thirds is often distinct green. A depressed transverse line cuts off from the front about one-third, which part is also divided by a longitudinal median line, into equal portions, each of which has a central rounded elevation. The pronotum is margined. The scutellum varies in color and is green or yellowish; the legs like the whole underside are greenish yellow; the feet or tarsi black at base and tip and light in middle.

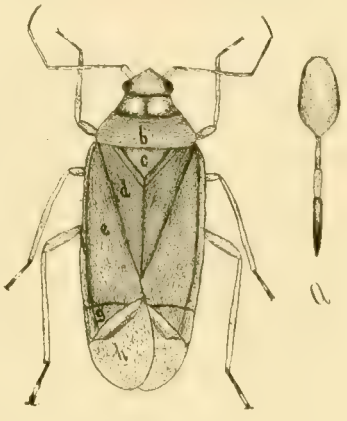

FIG. 1.

The claws are black; the wing covers are green. The clavus (Fig. 1 d) is dark green; the corium (Fig. 1 e) lighter; the embolium (Fig. 1 f) is narrow and still lighter, though the depressed line separating it from the corium is very deep green. The cuneus (Fig. 1 g) is indistinctly differentiated. The whole upper portion of head, thorax and base of wing covers is speckled with short, stiff, black hairs. The membrane (Fig. 1 g) is smoky, with a wide greenish basal margin which is dusky centrally and abbreviated externally. The narrow internal margin of the membrane is black. The insect is a little more than 4 millimeters (16-100 inch) long and about one-third as broad.

These bugs are a very serious enemy to the hollyhock. They swarm upon these plants early in the season, and often so suck out the juices or sap that the plants become blighted, and not infrequently wither and die. This year we treated these insects with the kerosene hard soap emulsion * * * * The plants * * * * were entirely freed from the pests.

The kerosene and hard soap emulsion is prepared as follows: Dissolve one-fourth pound of hard soap, Ivory, Babbitt, Jaxon, or whale-oil, etc., in two quarts of water, add one pint of kerosene oil, and pump (with considerable force for several minutes) the mixture back into itself while hot. This emulsifies at once, and is permanent with hard or soft water. This is diluted with twice its bulk of water before use. * * * * This also becomes, with certain soaps, lumpy or stringy when cold so that it cannot be readily diluted with cold water unless first heated. Yet this is true with all hard soap emulsons in case of certain soaps. We can, however, always dilute easily if we do so at once before our emulsion is cold, and we can also do the same either by heating our emulsion or diluent no matter how long we wait.—*A. J. Cook and C. C. Davis in Bulletin No. 76, Mich. Agr. College Expr. Station.*

NOW IS THE TIME to cultivate the local newspaper men, in order to secure advance notices of your exhibition and good reports of the same after it is open. Send every editor in town a handsome basket of flowers. And don't be niggardly. Do it right or don't do it at all. A $10-basket may secure advertising of a kind that cannot be purchased. Get the newspapers interested in your show and a taste of the beauties to come will more readily stimulate their interest than anything else. But don't depend entirely upon what advertising you get in this way. Have your announcement in the advertising columns also—not yet, but begin about a week before the exhibition is to open. Copy for the advertisements should be prepared now. The advertising committee should now be hard at work.

HAVE YOU appointed a committee to give information to reporters while the exhibition is open? If not, do not fail to do so. Some one member of the committee should be in the hall every moment the exhibition is open. All reporters should be referred to him, and he should devote his full time to them. Show them everything in the hall. Tell them why certain exhibits are of special interest. Give them material for a bright, readable report of the show. They will give space to a good thing, and as a result the paper will be pleased, the public will be pleased as well as educated and you will have advertised the trade and advanced floriculture with the people.

MUSHROOMS will "blossom" alongside of the chrysanthemums at the coming exhibition of the Penna. Hort. Society at Philadelphia. Messrs. John Gardiner & Co., of that city, offer four prizes for mushrooms, and the display will undoubtedly attract the attention and admiration of epicures as much as the varied hues of the chrysanthemums. But there is no reason now why epicures only should be interested in mushrooms. They should be a very common article of food, and will be as soon as the people learn how easy it is to produce them and how much easier and more gratifying it is to introduce them to their palates.

WE SHALL PUBLISH a corrected edition of our trade directory about January 1 next. Though we shall cover the whole country by correspondence, we invite corrections from anyone. And in order that your glass surface may be correctly given, send us a statement for yourself, over your own signature.

Minneapolis.

ED. AM. FLORIST:—The party who could be so heartless as to insert the notice about Mr. Wm. Desmond that appeared on page 194 of the FLORIST for October 8, without a proper explanation of the affair, deserves the censure of every fair minded person.

Mr. Desmond was unfortunate enough to be sent to the inebriate department of the asylum at Rochester, from which he has been honorably discharged as thoroughly cured, and is now hard at work trying to make an honest living for his family.

"A man's a man for a' that."

S. Y. HAINES.

Washington.

The cosmos has come again—a perfect deluge—and yet people ask, what is it? "A floral down," responded a florist, "but unlike Eider down, there is no money in it."

Cut flowers, especially roses, are both fine and plentiful for the season, yet trade is far from what it might be. A complimentary banquet given in this city to the World's Fair Commissioners of England, Germany and Denmark afforded the first opportunity for the fall season to indulge in a little floral display, and the Smalls made a success of it as might be expected. The table, oval in form, was profusely decorated with the choicest roses, while graceful palms and delicate vines tastefully hung imparted to the recesses and walls of the large dining room at the Arlington, a richness seldom rivalled. The Secretaries of the Treasury and of the War and Agricultural Departments were among the distinguished guests, likewise the Attorney General with Mr. McCormick and other noted Chicagoans.

During the week on occasion of the German Day celebration an industrial parade, in which several florists participated, took place. The Gude Bros. had a float of neat design representing Flora's bower; Freeman and Strauss each had large floats banked with elegant palms and ferns, while Studer's float was quite pretentious, representing on a dais under a canopy of palms the Goddess of Flora attended by four pages each holding staffs crowned with implements emblematic of the florists' profession. In front on an incline was a large floral horn of plenty from which floral gifts were dispensed to the crowd and on the sides of the float covered with bunting and garlands one could read the legend: "Flowers for all occasions from the cradle to the grave."

Our florists are actively preparing for their chrysanthemum show to come off next month, which some predict will be a decided success. Z.

CARNATION
GOLDEN TRIUMPH.

A Seedling of 1888. Makes a fine plant and gives beautiful flowers.

Also a pink Carnation named "DOROTHY," a seedling of 1888—one of the best.

HOW CAN YOU GET ALONG WITHOUT OUR

TRADE DIRECTORY?

AMERICAN FLORIST CO., 54 La Salle St., CHICAGO.

WHY You Should Grow Mushrooms.
Because they are the most profitable crop for the outlay that can be grown and may be grown without interfering with other crops. The market is sure, the supply never having been equal to demand.

WHEN You Should Grow Mushrooms.
During the Winter and Spring months, the first planting in August or September with successional planting until April.

WHERE You Should Grow Mushrooms.
Under the greenhouse benches, on the greenhouse benches among growing crops, in Rose Houses, in frames in the greenhouse, in cellars, stables or outhouses, in the open field or in mushroom houses.

HOW You Should Grow Mushrooms.

First get spawn that will grow. It must be fresh, well spawned, and in good condition. **Gardiner's Celebrated English Mushroom Spawn** is the best, and is always fresh and reliable. The details of culture are given concisely in our treatise, **"Mushrooms for the Million,"** Mailed free. **Falconer's "Mushrooms and How to Grow Them."** Published at $1.50. (Gardiner's price $1.35 post free.) **Robinson's "Mushroom Culture,"** 50 cts. postpaid.

GARDINER'S ENGLISH MUSHROOM SPAWN.

John Gardiner & Co., have made a specialty of choice spawn for years, and their celebrated English brand (made by the best maker in England, specially for their trade), has gained an enviable reputation among critical growers for its uniform good quality, and can be thoroughly relied on to produce a good crop of the best mushrooms. Orders booked now for delivery as wanted, $8.00 per 100 lbs. Special rates to large growers. Address all correspondence to **21 North Thirteenth Street,** Philadelphia, Pa.

AVOID THE RUSH.

It is undoubted true that many of our commonly accepted methods of culture originated in the chance discoveries of somebody. It is said that the finest Jacqs ever brought to New York for Christmas were the result of a mistake. Our growers are too much inclined to keep in the same rut as their neighbors, hence we have the crops of a whole section all piled in on the market at one time, whereas with more independent individual action on the part of the growers the crops would have been distributed over a longer period and been more profitable to all concerned. How often we hear a man fussing because he is a few days behind his neighbor in starting a lot of bulbs or plants, and yet it is almost always the fact that the crop which is a little ahead or the one which is a little behind is the one which is most easily and profitably disposed of. The early cut has the market to itself at first, and so has already an established outlet when the glut comes in; and since "having is keeping" as a general thing, it is not easily dislodged by the new comers. The thoughtful grower will now watch his chrysanthemums and take note of those that bloom earliest with him, as well as those that give evidence of being the latest, and next year he will give such varieties the preference over those that come in just at the time when the market is overloaded. It pays to have good chrysanthemums in October and a crop of nice blooms about Christmas time would not go amiss.

OWING to the lateness of the season several societies have decided to change the time for holding their chrysanthemum show to one week later. Note the changes that occur weekly in our list of coming exhibitions on this page.

SITUATIONS, WANTS, FOR SALE.

Advertisements under this head will be inserted at the rate of 10 cents a line (seven words) each insertion. Cash must accompany order. Plant advs. not admitted under this head.

The Seed Trade.

AM. SEED TRADE ASSOCIATION.

F. BARTELDES, Lawrence, Kan., president; A. L. DON, New York, secretary and treasurer. The tenth annual meeting at Hartford, Conn., second Tuesday in June, 1892. Applications for membership should be addressed to Wm. Meggatt, chairman membership committee, Wethersfield, Conn.

THE *Rural New Yorker* of October 19 makes the following statement which without other explanation is a serious reflecion on American seedsmen as a class. If the *Rural* knows the names of such firms, as it must do to make this statement, it should in justice to the seed trade make such knowledge public:

> "*There are seedsmen in America that buy just such seeds with which to adulterate fresh, pure seeds, for which they are obliged to pay—the market price.* They are the seedsmen who 'give away' seeds or offer them far below the market price in order to 'introduce them' and 'secure your future patronage.'"

MR. ERNST BENARY has received the Decoration of the Ritter Cross of Alberts Order from His Majesty the King of Saxony.

SECRETARIES of organizations giving exhibitions should keep on file a complete set of the premium lists issued by other organizations. They will be found exceedingly useful for reference. Send your own premium list and request an exchange.

WATCH our list of coming exhibitions. Changes are being made in nearly every issue and the list corrected up to date.

OUR TRADE CATALOGUE
OF
Rare Florida Flowers
AND FRUITS

TO MUSHROOM GROWERS:

WE desire to call the attention of Mushroom Growers to the Premiums offered for an exhibit of Mushrooms at the forth-coming Chrysanthemum Show of the Pennsylvania Horticultural Society to be holden in Philadelphia, Nov. 9th to 14th, 1891. These premiums have been offered in order to bring out a good exhibit of the "King of Esculents"—an exhibit that will have the effect of arresting the attention of the public in a striking manner to the great merits of a much neglected article of food—thereby increasing consumption and largely benefitting all concerned. The co-operation of Mushroom growers in all parts of the country is respectfully solicited to this end, because, the more public interest is stimulated the better it is for the growers eventually. If there should be any growers wishing to exhibit but not wishing to compete for the premiums, no difficulty would be experienced—in fact, any exhibit whether for competition, or for exhibition only, will be gladly welcomed. To any grower who would be willing to send an exhibit but who might be unable to attend personally to the entering, staging, etc. of an exhibit, the subscribers offer their services, and will gladly do all in their power to facilitate matters for the common good. They are willing to receive packages and to unpack and arrange same in a proper manner for exhibition, to enter them in the name of the grower and look after them during the exhibition—thus saving the exhibitor all trouble except the small matter of sending the package. We hope each and every grower will make an effort to send and exhibit. The larger the exhibit the better the general effect will be and the more good will eventually result to the exhibitors. Please drop us a postal as soon as you read this so that we may have an idea beforehand how many exhibitors there are likely to be, and the space necessary to reserve for exhibits.

Recommending this matter to your earnest consideration, we remain,

Yours respectfully, JOHN GARDINER & CO.

P. S.—Address all communications to our office at 21 North 13th Street, Philadelphia, Pa. Premium lists on application, and prompt attention to all correspondence.

F. A. BALLER, BLOOMINGTON, ILL.
Mention American Florist.

Montreal.

The Montreal G. and F. Club offers at their coming show, open to all, for the best 24 blooms of chrysanthemums, a silver cup, value $75, and a cash prize of $12. Anyone wishing to compete can do so by paying an entry fee of $2. The cup must be won three times before becoming the absolute property of the winner. We hope some growers south of 45° will send along a few blooms just to waken up the local men.

The recent exhibition of the Horticultural Society was wretched, a complete failure in every respect in fact. The directors thought they could run a show without the growers. Possibly the last show will teach the "powers that be" differently. Such an exhibition is bound to do harm, as the public like to get something for their money and will be careful before spending another quarter on a flower show.

Business is only fair as yet. The weather has been so fine and no cold nights that there are a quantity of flowers outside yet.

J. Bland's new hairy chrysanth will probably be on view in several places next month. J. B. thinks a "pile" of it.

B.

Peoria, Ill.

Trade very quiet the past month, and plenty of flowers in the market. Louis Miller is building three large houses for growing roses, carnations, violets, and smilax for the wholesale trade; steam heating. Cole Bros. are putting up two new houses for cut flowers. At our State Fair the collection of plants and cut flowers was much better than in former years, each florist doing his best to secure first premium. Mrs. Mat. Cation carried off first premium on general collection of plants, second on geraniums and best floral design; Cole Bros., third on general collection of plants, second on Rex begonias and cut flowers, first on geraniums in bloom, carnations, hanging baskets, single ficus, crotons, best design, cut flower basket; J. M. Cole, first on bouquets and dahlias; James C. Murray, first on Rex and winter flowering begonias, single palm, single fern and basket of cut roses, second on general collection of plants, carnations, third on floral design; Shoat & Wiley, fourth on collection of plants. It is to be regretted that the state board gives the florists such a small space to display plants.

M.

GOOD ASSORTMENT OF

PALMS,

from 2 to 8-inch pots, at reasonable figures, for sale.

Also will EXCHANGE for 1000 small Geraniums, and Flowering and Rex Begonias, in A No. 1 assortment.

Newport, R. I.

The wedding of Miss Havemeyer on October 15th was the last great society event of the season. The decorations were in charge of Siebrecht & Wadley, and under the skillful hands of Mr. Siebrecht, Mr. Lee and their assistants the house was fittingly prepared for the big event.

The mantel in the dining room was banked with allamandas, Oncidium Rogersii and Perle roses, making with dark foliage a splendid yellow effect. In the fireplace was an immense vase of American Beauty roses. On the mirror frame were hung vines of Black Hamburg grapes loaded with ripe fruit. Around the bride's cake and the candelabras on the table were heavy wreaths of lily of the valley and Adiantum Farleyense.

The smoking room was decorated in red. The mantel and mirror looked gorgeous with branches of Berberis Thunbergii and other red berried shrubs. In the pink parlor, so called, the walls and ceiling were completely covered with white lace. The room is octagon shaped and in each corner was placed a huge vase of Mermet roses from which sprang traceries of ivy vines which showed beautifully on the white lace walls. Grace Wilder carnations and pink chrysanthemums were also used largely in this room.

In the bridal room there was a heavy screen back of where the ceremony was performed made of rich foliage and white flowers. Overhead was a canopy formed of white ribbons and Asparagus plumosa intertwined. Lily of the valley and white roses in great profusion adorned this room, and on the mantel was a beautiful mass of Dendrobium formosum gigantum.

When sending us small amounts in postage stamps, please select those of the 2-cent denomination.

When you write an advertiser tell him that you saw his advertisement in the American Florist.

THE CHEAPEST AND BEST OF ALL.
FIR-TREE OIL
INSECTICIDE—soluble.
FOR PLANTS.—To make a solution for washing or cleansing purposes—Half-a-Pint of Fir-Tree Oil to ten gallons of water.
For Green and Black Fly, Thrip, American Blight, Wooly Aphis, etc.—Half-a-pint of the Fir-Tree Oil to two or four gallons of water, or two or three tablespoonfuls to the pint.
For Red Spider and Caterpillar—Half-a-pint of the Fir-Tree Oil to two gallons of water, or three tablespoonfuls to the pint.
For Mealy Bug, Brown or White Scale—Half-a-Pint of the Fir-Tree Oil to four or six quarts of water, four to eight tablespoonfuls to the pint.
For Mildew and Blight on Fruit or Foliage—Half-a-Pint of the Fir-Tree Oil to a gallon of water, or six tablespoonfuls to the pint.
Used with warm water it is quicker in its action than when cold is used.
Soft or rain water is necessary, and Applied in Wood, Tin or Pot Vessels.—Galvanized Iron Vessels must not be used.
FOR ANIMALS.—For Skin Diseases and Killing Vermin mix one part of Fir-Tree Oil with three parts of warm water and wet the affected part each day. In some cases it may be used stronger. For Ring-worm apply full strength with a brush each day.
FOR BIRDS INFECTED WITH PARASITES.—Put a tablespoonful of Fir-Tree Oil in one quart of warm water and dip the bird in it, taking care that its eyes are protected, hold the bird in one hand for one minute, then dip into clean tepid water; this may be repeated. If necessary a much weaker solution may be used with a spray producer.
Sold in Bottles and Tins.

AUGUST RÖLKER & SONS,

NEW YORK,

136 and 138 West 24th Street, near 6th Ave. Address Letters Station E.

San Francisco.

If the cherished dreams of the commissioners are fulfilled, Golden Gate Park, or a section of it at least, will resemble the luxuriant gardens of the South Sea islands or the verdant forests of tropical New Zealand in a few years to come.

About three years ago the guardians of the people's pleasure ground brought from Australia a hardy specimen of the cibotium, or tree fern, and transplanted it in a favored spot near the lodge. The conditions to its growth were favorable and the fern has thriven beyond the most sanguine hopes of its careful watchers.

Satisfied that the experiment was a success, the commissioners two months ago engaged R. K. Stevens, the botanist, of Santa Barbara, to visit Hawaii and select several hundred of the tree ferns and also of the dwarf ferns that he could obtain in the islands. The first fruit of the botanist's efforts have arrived in the shape of 300 specimens of the cibotium. In a letter which came by the same steamer Mr. Stevens states that in another month he will have ready for shipment 200 plnats of the adiantum and 1,000 aspleniums, besides 50 specimens of the royal palm.

The home of these tropical emigrants will be on the east side of Strawberry hill. If the present plans of the park commissioners are carried out an immense gorge several hundred feet in length will be excavated. At the head there will be a waterfall with a depth of 70 feet, and the ferns and the palms will be planted closely together and in artistic confusion along the sides of the canyon. The effect will be a bewildering mass of charming green foliage, such as can be seen only in the rich forests and gardens of Hawaii.

A force of men are now at work on the excavation and the commissioners hope to have it completed by May 1st. The plants in the mean time will be nurtured in the conservatory.

The police recently made a raid on the fakirs for peddling flowers without a license and a whole patrol wagon load were taken to the station. The Florists' Club takes care that the cases are vigorously prosecuted, and the war on the fakirs is now wide open.

The magnificent show of tuberous begonias at Golden Gate Park conservatory last month attracted hosts of visitors and excited universal admiration.

THE PRESIDENT of the Agricultural and Horticultural Society of Marion county, Ind., rejoices in the pomological name of John W. Apple.

THE thirty-fourth annual meeting of the Missouri State Horticultural Society will be held in Sedalia December 1, 2 and 3.

XMAS DECORATIVE PLANTS.

SHORT HILLS, N. J.

About Eating Orchids.

ED. AM. FLORIST:—I was quite surprised that you should let the paragraph "never ate orchids" appear in your paper without correction. When the judge exclaimed "how may people eat orchids?" he evidently supposed the orchid was an article of diet indulged in only by epicures. The foot note would seem to imply that orchids were not an article of diet at all. Both of which are erroneous. The extract of several varieties of one species of orchids is a common article of commerce. I venture the assertion that every person in that audience had had his palate tickled with vanilla, which is an extract of the fruit of various species of the family of orchids by that name.

J. T. A.

[Probably every one in that audience had also eaten cocoa nuts and dates, and would you therefore say that they had eaten *palms?*—ED.]

A Brilliant Judge.

At the recent fair of the New York State Agricultural Society at Syracuse, the judge of the floral exhibit awarded first premium for best *dinner table design* to a floral piece illustrative of "Simply to Thy Cross I Cling." It was a slanting, standing cross, with broken wreath hanging over the two arms, on which the quoted sentence appeared. At the foot and behind was a doll clinging to the cross.

After the award had been made the "judge" was told that the piece was not a dinner table design. He said that he "supposed it was."

Can we manage to in some way impress upon the managers of fairs the absolute necessity of having judges that know something about what they are to judge?

THE Rhode Island Hort. Society has postponed the chrysanthemum show one week, making the dates November 12 to 14, instead of as before announced.

AN ENVELOPE postmarked Springfield, Mass., and containing a dollar bill and nothing else, has reached us. Will the sender please forward his name and address?

The Artistic Grouping of Flowers.

BY F. SCHUYLER MATHEWS.

II.

The most difficult element which we have to meet and control in the grouping of flowers is the color effect. We always have to contend with insubordination in this direction, and, as I have had occasion to say before, there is a positivism and self assertion about some flower colors with which it is difficult to contend. Then, too, when we have fought our good fight, and rest securely in our own convictions that we are victorious, along comes somebody who shatters our self-satisfaction with the cold remark, "A good composition, but what an awful combination of color!" Our one answer, which is beyond refutation, must be, "The color is natural; it follows nature." But it is to be presumed that we have followed nature intelligently and skillfully.

For instance, in the morning glory and the sweet pea we may observe a perfectly beautiful combination of crimson, purple, and violet. Notice the charming gradation of color in the morning glory; one tone runs into the other with a subtlety which is quite wonderful, and all the colors merge into the luminous green white center from absolute positivism to perfect delicacy with an ease which is surprising. Now, let us try to mass a large group of crimson, purple, violet and greenish white asters together with the same result. Alas! what a task it is and how confused we become with the distracting color tones; but we must feel our way carefully and systematically. First, our most powerful color—crimson or violet—must be grouped gracefully and placed in a prominent position; next, we must run our color tone either toward blue or crimson, as the case may be. If we have any gaslight near we must make use of it to accent our prominent group, and last, mingled slightly with the palest tones of dull pink and purplish blue, or may group our greenish white asters in some position where they will contrast well with the strong color group, and where they will be sure to have the intermediate blue and crimson tones act like a bridge to connect the color scheme. Nothing distracts the eye so much as violent transitions of color.

Speaking of violent transitions, positivism, and insubordination, what unruly creatures we have to deal with in the Calendula officinalis and the African marigold! The most modest transition we can arrange for these all-powerful yellow and orange hoydens is one toward white. The positivism of these flowers we may take advantage of, and create a wealth of golden tones in flower masses, ranging from the primary yellow to the most intense orange. Try these rich golden flowers all by themselves, and notice that either in rooms with dark, somber draperies or in those whose effects are purely white and delicate, they are strikingly appropriate, and sometimes as dainty as they are strong! It all depends upon the skill exercised in their arrangement; the backgrounds are an all-important factor in the case; a black silk Japanese screen, a straw-colored silk scarf, a delicate white and gold patterned wall paper, these are all well calculated to relieve the intense hues of the calendula and marigold.

Then what can be done with the insubordinate, self-asserting dahlia. Some folks call it stiff and artificial; to me it seems stately and royal. I fear that in the rage for the chrysanthemum and orchid we shall well nigh forget some of our truly regal old-fashioned flowers. But to tell the truth, in the revival to-day of fashions in strict accordance with our grandmothers' days, houses, furniture and silver have no greater claim to our particular attention than nosegays and flower-beds!

Therefore, the place for our gorgeous, old-fashioned dahlias is in the revived and stately colonial mansions of to-day. Do not be afraid of the rich yellow and wine-colored varieties; use them with a good proportion of the foliage, and do not constrain them into conventional bonds; they are conventional enough in themselves; besides, the natural droop of the flower on its stem is too beautiful a quality to neglect.

And now to turn to a perfectly dainty and delicate arrangement of two very common yet lovely old-fashioned flowers, the Chameleon or the Pearl nasturtium, and the pale Centaurea cyanus. Here is the opportunity for a thoroughly refined little bit of color. I should use only the centaurea, whose color is either white, with the pink or the blue center, or pale blue with the purple center, or lavender with the pink center. Nothing can possibly exceed the daintiness and perfection of this color combination; it is positively refreshing! No doubt most florists will be skeptical about any flower colors being daintier than those of the paler roses, but the delicate, pale lavender blue and the straw yellow are not to be replaced by any rose tints! Only a parallel is to be found in the Perle rose and the palest blue violet, and this is less satisfactory, because it is rather commonplace. The commonplace, we must remember, is what we ought, if possible, to avoid.

The wide range of color afforded by asters is a temptation for one to employ them in great variety for decoration and in arrangements marked by no distinct idea of a color scheme; this is a mistake. I have before me a lovely pure pink variety, which I notice is damaged by the proximity of any purple varieties. With white, the pink is always beautiful, and I also note that some of my blooms of a pale purple tone inclined toward the pink look very charming beside my perfect pink blooms; but here we have an analogy

of color tone which, if skillfully adjusted, must always result in rainbow effects of color, pleasing beyond expression. We must bear in mind, though, that the brightest tones in our collection must be reserved for the prominent position. The so-called blue asters we ought *never* to place beside those which are pink, crimson, or deep purple and violet. They are really of a purplish blue, and their next neighbors should have very little strength of color deeper, whether the direction be toward the red tone or the blue tone. Delicate colored asters always look best separated from those of a strong and positive tone. We may be reasonably successful with groups of white and pale colored flowers, also with rich purple and violet tones; we may secure sharp contrasts where needed with white and dark purple, but the indiscriminate mixture of all colors, where care is taken to have only those coming in juxtaposition with each other harmonize fairly well, this, generally results in confusion. Such an arrangement savors more of the exhibition, and really, if we wish our flowers to tell of their *own worth* and *beauty*, we should aim less at *display* and more at harmony and union. In music we would employ the terms "jumbled medley" and "simple melody," to distinguish such opposite ideas. We do not hesitate in a choice between the two; one is vulgar, the other is beautiful. One is refined and natural, the other is coarse and artificial. If we would advance the standard of good taste, we must not countenance anything either gaudy or noisy.

"Afraid to Tell the Truth."

The following note appeared as an editorial in the *Rural New Yorker* October 17:

"The committee on nomenclature of the American Florists' Society are evidently timid about saying anything that might offend anyone. 'In examining our florists' catalogues,' the report states, 'your committee has found it a difficult matter to find out many mistakes intentionally committed, with the view to deceive and defraud.' Great conscience! Mayn't we assume that florists who will manufacture names for their 'novelties' will lie as to the *intention?* The fact is, dear committee, you are either *afraid* to tell the truth, or are unwilling to incur the displeasure of your associates by a candid exposure of their 'unintentional mistakes.'"

The above remarks are unmerited and unjust.

In a letter to the *R. N. Y.* last spring I appealed to its readers for information about any plant grown in their neighborhood under two or more names, and also asked them to notify the committee of any case they knew in which a plant had been sold under a false name or under two or more names, that the matter might be investigated. Quoting from another letter of mine, in which I asked to be informed of any instance wherein a dealer or florist misnamed a plant intentionally for some selfish or mercenary motive, that we might bring his sin to the knowledge of the world, the *R. N. Y.* urged its readers to help us in these words:

"The *R. N. Y.* appeals to its readers to render what assistance they may to aid the good work." Further, believing the *R. N. Y.* to be actively interested in this sort of work, and on the strength of many years of warm personal friendship between its editor and myself, I appealed to him as an individual, soliciting his aid in this nomenclature business. His reply was kind and courteous, but he did not bring any case to my notice. Now, if the *R. N. Y.* was fraught with *facts* regarding fraudulent nomenclature by florist frauds, why didn't it let us have them when we asked for them? And I here declare that not one of its readers has brought a case to my notice that has not been promptly, pointedly and fearlessly investigated, and I challenge proof to the contrary.

No, we do not *assume* that any florist *lies*. We deal with facts as we know them to be facts.

The statement that "you are either *afraid* to tell the truth or unwilling to incur the displeasure of your associates by a candid exposure of their 'unintentional mistakes,'" without giving a particle of evidence to sustain it is, in my opinion, a cowardly act; anyway, it is untrue.

WILLIAM FALCONER.
Chairman of the Committee on Nomenclature, S. A. F., for 1891.

Monstera Deliciosa in the Greenhouse.

This magnificent specimen of one of the boldest and handsomest of tropical Mexican creepers is growing in a rockery that was built by Floricultural Chief John Thorpe some years ago in the north end of the great palm house at Allegheny City Park. This greenhouse is 120 feet long, 40 feet wide and 28 feet high. It is only in buildings of such generous proportions that fine plant effects of this sort can be secured and as this Allegheny greenhouse is but a pigmy in size compared with the noble horticultural building being erected for the World's Fair, the monstera before us is only a gentle reminder of the tropical luxuriance we may expect to view when we visit Chicago in 1893.

The monstera has three points of interest, namely, its immense naturally perforated foliage, its very large, boat-shaped, arum-like, white flowers and its long cone-formed, edible fruit, which is so pleasing to the taste as to secure for the plant its specific name, deliciosa. It is also known by two other names, Philodendron pertusum and Tornelia fragrans.

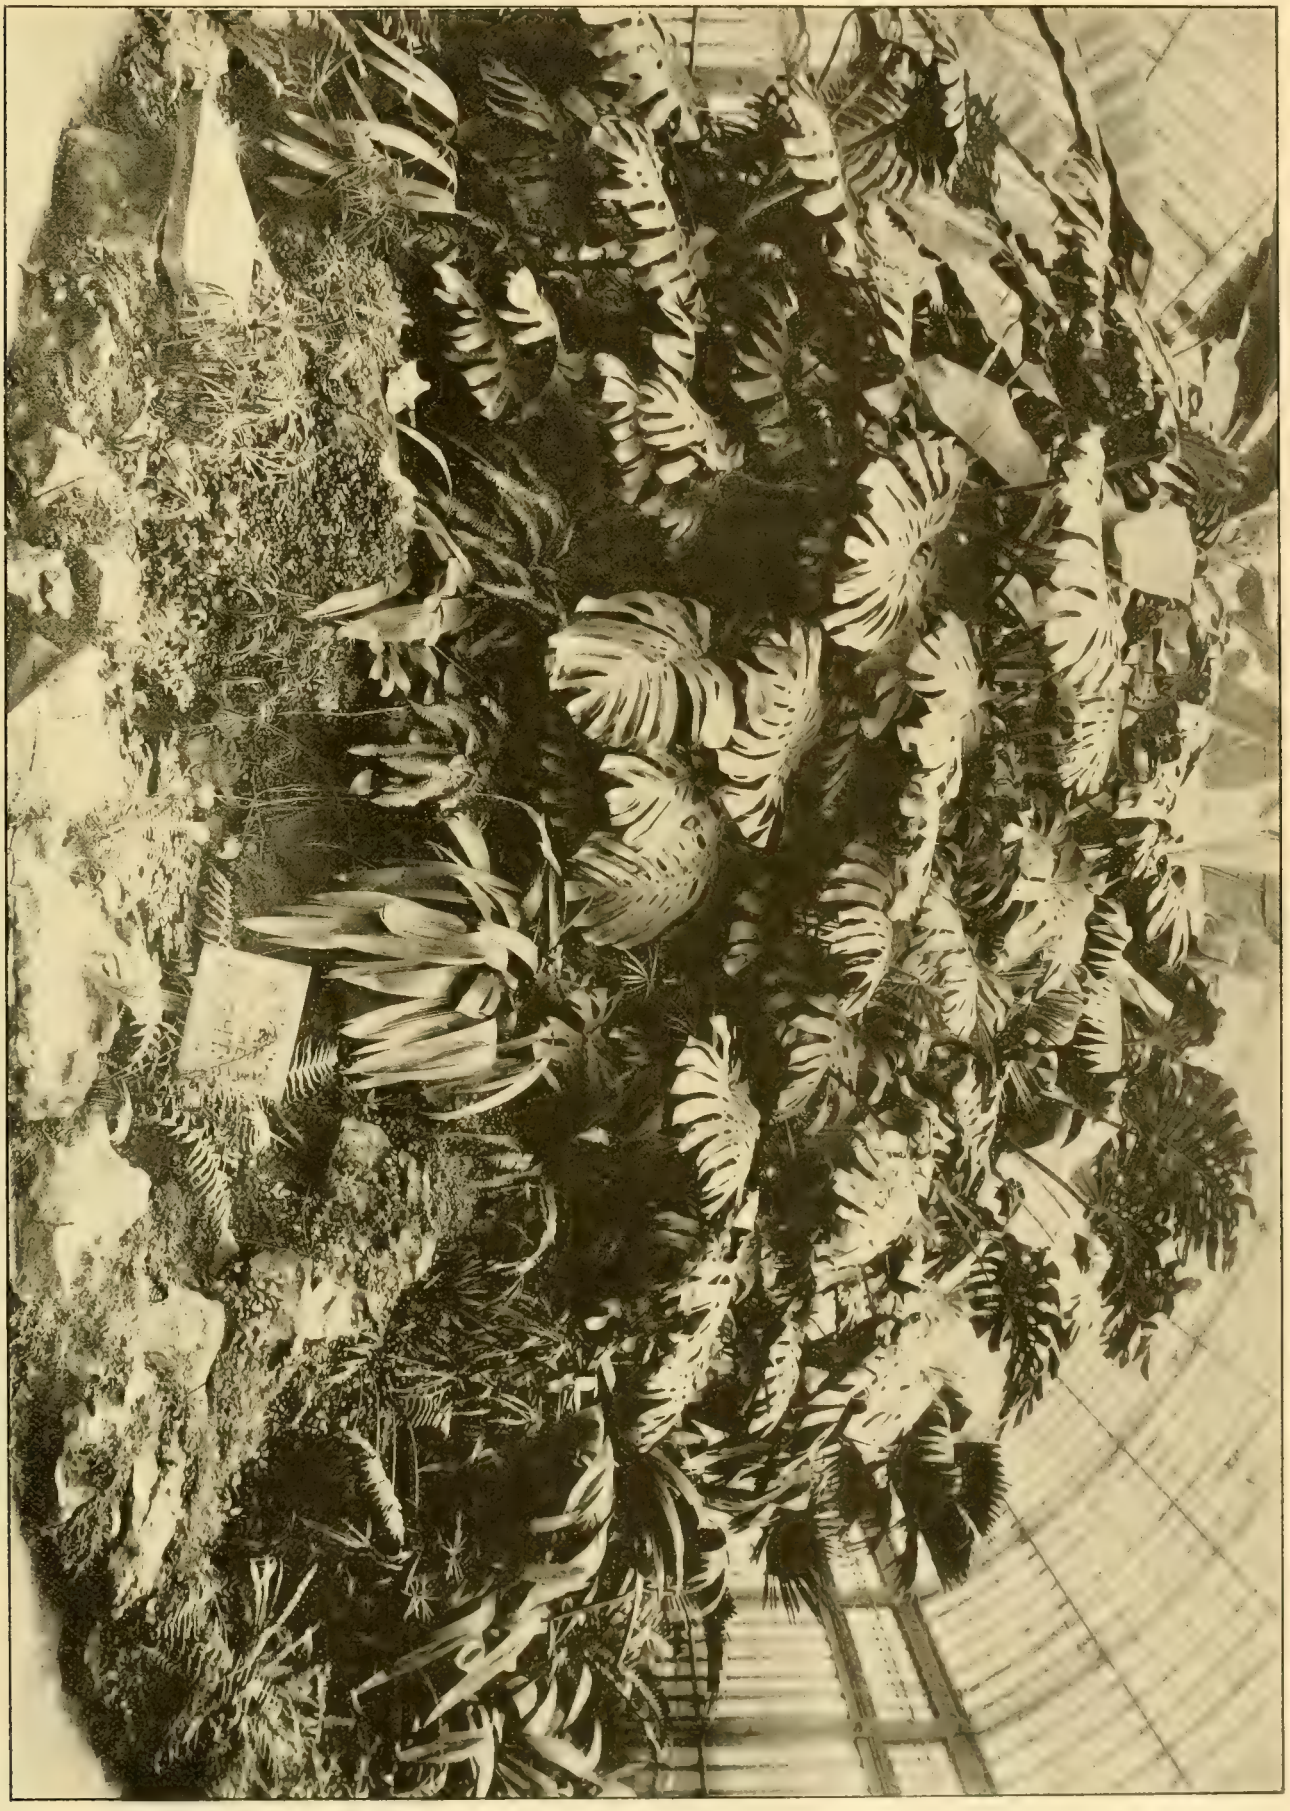
It enjoys warm, shady quarters and abundant moisture at all times. It may be grown indoors all the year round and is better fitted for rock work as we see in our illustration, for spreading under palms, tree ferns, banyans and other tall growing tropical plants in the greenhouse or climbing up their stems or against a moist wall, than for ordinary pot culture. Its great, thick, rope-like roots dislike to be restricted to pot room, indeed, they are willing to run out or down 20 feet to get at earth or moisture, providing they have liberty, and it matters not whether or no the stem of the plant reaches the ground or gets within a dozen feet of it, providing the roots get there.

The flowers are massive and showy, but we can hardly call them beautiful. Old plants having plenty of room to grow in and which run up to the light, flower freely and set and ripen fruit and the fruit is real good to eat, only like many other tropical fruits it takes very little of it to satisfy our northern appetites.

This plant is also freely used in outdoor summer gardening, where it is massed or spread in isolated way with tender ferns, palms and similar plants in moist sheltered and somewhat shaded dells to give a tropical effect. Fine examples of its use in this style may be seen every summer in Battersea Park, London. Of course for this kind of gardening the plants have got to be grown in pots or tubs and when set out in summer the pots are plunged in the ground and sodded over. W. F.

Some Recent Improvements in Old Fashioned Flowers.

ANNUALS.



There are some very noticeable improvements in the flowers that were always to be found in our grandmothers' gardens and the change in size, shape, texture and coloring is so great that the old ladies would scarcely recognize them as being any relation to the flowers they cultivated and prized so highly.

Among the many worthy of mention is the zinnia. Until very lately these flowers were looked upon as only fit for planting in some out of the way corner, or to fill gaps in the mixed borders, but now the collections of imported seeds put up in separate colors come so good as to be worth a place in the best part of the flower garden. Those I have grown this summer were all perfectly double, true to the color described on the package, and have not grown more than eighteen inches high and are at this date (October 5) as full of good flowers as they have been all summer. I usually plant them three together in order to pull out any inferior or single flowers, but this year there were none to pull out, all were double and many shades of color that I had never seen before in this class of plants. Another good quality they possess is, no matter how wet the weather may be, they keep on flowering just the same, the flowers retaining their brightness through it all, when the geraniums had not one good flower to be seen. This was particularly noticeable during the heavy rains in August. These are flowers that any one can grow, they need no artificial heat; all I do is to sow them in a cold frame the first week in April; the seeds are sown in very shallow drills and when large enough planted where they are to flower.

The aster is another flower that has been greatly improved of late. There is scarcely any resemblance between the best strains of this flower to-day, and the old fashioned "China Aster" with its single ray of petals and coarse, bare center. There are several florists in this country that have spent some years in improving the already good German varieties. The result is flowers as perfect in form as the best of the chrysanthemums. The only drawback to their use as a florist's flower is their short duration, but this is overcome by sowing at different periods and growing them along in pots or boxes. For ordinary flower garden decoration the sowing and planting is the same as above described for zinnias.

Poppies have been improved within the last few years, particularly the tall large flowering varieties. The so-called Shirley poppies are beautiful, so are the tall globular and fringed varieties, making a perfect ball or pompon, but I have seen no improvement on the dwarf French poppy sent out by Carter of London in the year 1848. These were called carnation poppy and were as double and fringed as possible, the colors principally scarlet and white edges. Poppies can not be transplanted, but must be sown either in pots or where they are to flower; they make a long tap root and all plants making this kind of root are difficult to transplant. During dry hot weather these plants are subject to the attacks of black fly and a sort of mildew, which makes their flowering very uncertain.

The marigold is another old fashioned

MONSTERA DELICIOSA ON A ROCKWORK IN THE ALLEGHENY PARK CONSERVATORY.

flower that has been very much improved lately, the African even more than the French varieties. The robust growing and free flowering sort known as Eldorado is much superior to any we have had hitherto. I grow no other kind now, for if good select seed is sown nearly all the plants will produce large double flowers, and in two decided colors, that

is a clear orange and a clear lemon color. For a background to the mixed borders or groups to be seen at a distance there is no annual more effective. French marigolds are, strictly speaking, an autumn flower, and will make a display with less attention than any other annual. They are particularly suited for planting in city gardens, as a smoky atmosphere does not hurt them, the first frosts of autumn do not mar their brightness, and another advantage is, they can be lifted and replanted in dry weather if wanted to fill any gaps, even when large plants and in flower. If a good quality of seed is sown nearly all the flowers are double and of a pleasing mixture of colors, ranging from pale sulphur to yellow, orange, maroon and endless variations in striping. But the great drawback to their use as a florist's flower is their vile smell. Neither of these marigolds can be used for bouquets or other decorations on that account. The greatest improvement in the plant formerly called pot marigold (Calendula officinalis) is to be seen in the variety called Meteor. Our grandmothers would hesitate before pulling this flower to pieces to put in broth, as they formerly did with the single variety. There is no comparison, they are now so double and such good colors, last well after being cut, bloom readily all winter, and are a great acquisition where cheap flowers are wanted.

Portulacca is another old fashioned flower that has come to the front again. It was formerly objected to on account of its being closed for one half of the day, but that does not apply to the new type, for they are now to be bought as double as a ranunculus, in fact, I have grown some this year that were so full of petals that they could not close, making them just as effective as when fully open. They are of no use for cutting, but for a dwarf border on dry or sandy soil, requiring no care after sowing except to pull out any large weeds that may appear, I know no flower that is so little trouble to grow.

The Sweat Pea is another flower that has been so much improved that it has become one of the most fashionable flowers for several seasons and has had special prizes offered and a show to itself in Boston the past summer, and well it deserved it. There were some beautiful samples shown of the latest improvements in this flower. Many years ago when we got a variety called the Scarlet Invincible we thought there could be no improvement, but Mr. Eckford and other growers have sent out some entirely new colors with more flowers on a stem and much freer flowering than the old sorts. There is quite a demand for them as a winter flower, and I have had them in bloom nearly the whole year, but to succeed with them in winter they demand all the light that can be given them. For outdoor flowers I make trenches and put in plenty of manure, two feet deep, and sow early. This deep manuring keeps the foliage good in dry weather and in a great measure prevents mildew.

SAMUEL HENSHAW.

Carnation Diary Wanted.

Would it be possible to have the diary of one of our good growers, who runs largely on carnations, published in the FLORIST? I for one would greatly appreciate it. I. A. P.

[We should be very glad to receive such for publication.—ED.]

ALWAYS mention the AMERICAN FLORIST when writing to advertisers.

Seasonable Notes.

EXHIBITION FLOWERS.

Just as soon as any flowers are nearing perfection cut them at once; don't wait until they are fully open. If the weather is very bright it is best to cut them early in the morning; always cut with good, long stems and put in water *momentarily*, so as to prevent the slightest evaporation. The best place to keep flowers is in a basement, where the temperature is at between 55° to 60° and the light is just enough to distinguish the flowers without any glare. Before finally putting the flowers away get something like a ordinary water pail, fill it full of clean water, place the flowers in carefully, having each stem held in position, so that the flowers are erect; eight or ten flowers are enough in a pail; and every other day go over the entire lot, place them in fresh water, first cutting off about one-half an inch of the stem. The flowers will grow almost a third larger in a week and they will last for three weeks if cared for.

Don't fail to look after those stock plants to see now that next year the plants are true to name; O. K. the labels.

I have just found out who Mary Edd is. She is neither more nor less than the true old Pompon, Madame Domage, who has been meandering round for the past 20 years as Precocite, Old White, Jardin des Plantes, Hutt's Market, together with several other aliases. JOHN THORPE.

Growing Specimen Blooms.

BY WILLIAM KIRKHAM.

[*Extract from paper read before the Chicago Florist Club, October 22.*]

Chrysanthemum growers commence to put in cuttings from November to March, and even later, but for our mode of culture I consider the early weeks of February a very suitable time. By striking them at that time we have not the amount of care to give the cuttings that we would were they struck two or three months earlier, and can have equally good results.

In February I prepare boxes 18 inches long and 12 inches wide. I prefer the boxes to the benches for propagating for the reason that I can move them and their contents about from place to place as I see fit. The boxes are filled with a compost of loam and sand, and the cuttings inserted in rows about two inches apart. They are then placed in a temperature of 45° to 50° at night, and shaded through the day from the direct rays of the sun. As soon as the cuttings are rooted, and before the wood begins to make any growth they are potted into 3-inch pots, potting moderately firm and using a compost of loam and rotten manure, with a very little sand, and placed back again in the same house with the same temperature until the plants have taken hold of the new soil, which will be in three or four days, after which the temperature can be lowered. In fact, the cooler the house is kept, so long as it is kept from freezing, the better it will be for the young plants. When the pots begin to show signs of filling with roots and before they are pot-bound, they must be moved on into a larger size, slightly pruning the roots while potting. Place back again in the cool house, not forgetting to give air on all favorable occasions.

When the young plants have attained the height of four inches, they should have their first stopping. Care should always be taken to stop them a week or ten days previous to potting at any time, so as to allow them to break into new growth. As soon as the pots begin to fill with roots they should be potted on until they get into their blooming pots.

During their young stages very great care must be exercised in watering, especially in April and May, before they are potted for the last time; if they are overwatered in the early part of the season, and particularly while they are in the small pots, they are very likely to grow too quick and get pot-bound before you can get them into their blooming pots and if once they get pot-bound and grow up thin and weak, the season's work in a manner is so far lost, as you cannot get such good results afterwards as you could if the plants had never had a check. This applies more particularly to pot culture than it does when you plant them out on a bench.

From now on removing all superfluous growth must be attended to. If any suckers appear from the roots they must be pulled off, and only two shoots should be allowed to remain on a plant. When these two shoots have attained a height of four inches from the last break they must be stopped for the last time. After they have broken they must be reduced from three to six shoots to a plant. When the shoots from the break are half an inch to one inch in length, if the pots are nicely filled with roots, they must be removed into their blooming pots, which may be either 8 or 9 inches in diameter.

The soil should consist of good strong loam broken up roughly, adding thereto a liberal supply of rotten cow manure, plenty of bone dust and mortar rubbish, mixing the whole well together. The soil should be rammed into the pots as hard as possible—in fact, if the soil is in a moderately dry condition it is impossible to ram it too firm, using for the purpose a strong ramming stick. When the plants are potted they should have a stake put down the center of each plant to secure them from the strong winds. Give very little water for a few days until the plants have taken hold of the new soil.

The plants will now want frequent attention by keeping all the laterals rubbed out from the joints up the stem as fast as they appear, as well as all the root suckers. As soon as the plants have got well hold of the new soil they should be watered once a week (increasing it in two or three weeks to twice a week), with some kind of liquid manure. A good manure can be obtained from the cowshed, stable or chicken-house, but what is better (if all the kinds can be obtained), is to put equal proportions in a barrel with an equal amount of soot, fill the barrel up with water and allow it to settle for a week or two before using, then add one gill to every gallon of water. After a few weeks it can be increased to one pint to every gallon of water, and by this time it can be used three times a week, always supplying it after the plants have been watered with clear water. The chrysanthemum is a very voracious feeder and is all the better if a change of food can be given to it.

In the latter part of August and early in September the earliest varieties will begin to show their flower buds, and as

soon as they appear all except the center buds must be eradicated. This is a delicate piece of work, and needs to be done with great care, or else the center bud will be damaged and consequently they will open deformed. One of the secrets of success in growing large flowers is the taking of the crown bud as soon as you can see it. Soon after these crown buds are formed, say a week, each pot should be top dressed with some rich material.

Regular attention must still be maintained by taking off all superfluous growth. By this time the plants should have the benefit of being fed with some ammoniac manure, of some kind, and nothing is better than sulphate of ammonia once or twice a week, dissolving about half an ounce in one gallon of water. The plants should be watered with this ammonia until they are nearly half expanded or until they begin to show color, when it can be discontinued altogether. By the last week in September or the first week in October the plants must be taken under glass; all the air must be left on day and night that is possible. I am a great advocate of Mr. Thorpe's plan in regard to air with a gentle artificial heat running through the house to prevent an attack of mildew. The gentle heat that is thus afforded them helps also to expand their blooms to more perfection and a larger size.

In the discussion that followed the reading of the essay, Mr. Gardner gave an amusing description of his experience in trying different systems of growing the chrysanthemum. He had taken cuttings from the same plant, apparently of equal vitality, and rooted and grown one batch in his ordinary potting soil, another in a compost of half soil and half manure, and a third in pure manure, and he could not see a particle of difference in the growth and general appearance of the three lots. He spoke of a trouble he had with his plants this year that he had never experienced before. The crown bud did not develop, but when very small it ceased growth and a number of new buds would start from around the crown bud. And the best thing he could do was to take one of these buds and rub out the others. He had also been troubled by buds starting all along down the stems, and it had kept him busy rubbing them out.

A very lively discussion upon the question of prices that could be obtained for specimen chrysanthemum flowers in the Chicago market then followed, and the retailers present were nearly unanimous in the assertion that $3 a dozen was the highest price that chrysanthemum flowers could be retailed at in Chicago, be the flowers ever so fine. And Mr. Kirkham and other growers rejoined that it would cost the grower fully $25 per 100 to produce such flowers as he had described. Mr. Benthey announced that he had contracted for a lot of flowers grown to single stem, and every one a specimen, at $10 a hundred, taking all the party cut from a house 100x18. He expected to pay for 3,000 flowers, which would make the returns to the grower $300 from that house. But this was a concern that grew mainly bedding plants, and the chrysanthemums took up space at a time when it could well be afforded. The cut flower growers thought it might pay under such conditions, but that it would not be profitable to one who was growing other cut flowers and could use the space to advantage for other cut flower producing stock. Mr. Weinhoeber said that they disbudded but very little, as they found that loose sprays of moderate sized flowers, with buds and plenty of foliage, sold better with them than specimen flowers, and that such sprays were also more profitable to grow.

New York Chrysanthemum Show.

In addition to the list of special prizes, etc., given in the AMERICAN FLORIST of October 8 there are ten more silver cups to be competed for. These are given by some of the prominent society people of New York and are offered for a great variety of things which will add many attractions to the show.

There will be a Japanese pagoda with native attendants who will offer for sale Japanese wares in all their curious and beautiful forms, for which some specially new things have been imported direct from Japan.

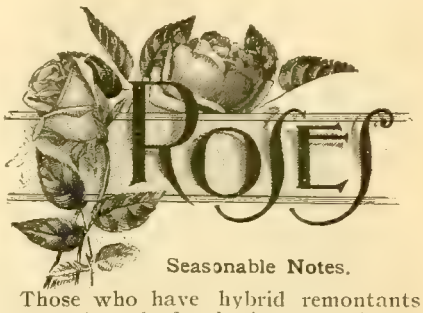
Entries for the floral display are coming in very fast and notwithstanding the enormous size of the building from present indications it will hardly accommodate the exhibits.

The plant potting competition will take place during the afternoon and evening of Wednesday, November 4. It is open to all; entries for the same should be made in writing to Mr. William Plumb, general superintendent Madison Square Garden. Pots, plants, etc. will all be furnished by Messrs. Henderson.

The following gentlemen have been invited to act as judges: E. G. Hill, Richmond, Ind.; John Thorpe, Chicago; J. A. Pettigrew, Chicago; J. T. Anthony, Chicago; Edwin Lonsdale, W. K. Harris, Robert Craig, John Westcott, H. H. Battles and John M. Hughes, Philadelphia; W. J. Stewart, F. L. Harris and E. A. Wood, Boston; W. R. Smith, Wm. Saunders and Henry J. Small, Jr., Washington; Wm. Falconer, Glen Cove, N. Y.; B. F. Dorrance, Wilkesbarre, Pa.; W. J. Palmer, Buffalo; A. M. Murdoch and R. C. Patterson, Pittsburg; Wm. Emerson, Staatsburg; F. Mangold, Irvington; Alfred Meredith, Pittsfield, Mass.; Wm. Grey, Albany, N. Y.; Alexander MacLennon, Oakdale, N. Y.; Wm. Mitchell, Highland Falls, N. Y.

As new exhibits will be staged each day to give greater attraction some of these gentlemen will be required for each day, hence the long list selected.

The only drawback that may possibly occur to its entire floral success is the possibility that some of the very finest varieties may not be fully open in time to be seen at their best. Growers are all anxous for bright weather from now till the show opens. JOHN N. MAY.



Chrysanthemum Names.

It gives me pleasure to be able to report that registration of the names of new chrysathemums has commenced. It is to be hoped that every raiser and disseminator in the country will follow suit, just as soon as names are selected. Here is T. H. Spaulding's list:

American Flag, Amy Carey, Annie Lonsdale, B. S. Hubbell, Christopher Columbus, Chicago, Columbia, Columbian, Chow Chow, E. Hetzeroth, Ethel Paul, Excelsior, Gus Bennett, J. N. May, Lillian Russell, Looking Backward, Mamie Craig, Masterpiece, Mrs. J. W. Morrissey, Pauline Hall, Ruth Cleveland, Standard, Shenandoah, William Barr.

EDWIN LONSDALE,
Sec'y American Chrysanthemum Soc.

PLEASE mention the AMERICAN FLORIST every time you write to an advertiser in these columns.

Seasonable Notes.

Those who have hybrid remontants prepared ready for forcing, and wishing to get early bloom from the same, should lose no time in pruning and getting them ready to start into new growth; but before doing so it is well to be sure that the wood is well ripened, otherwise a fine crop of blind shoots instead of buds will be the result. Such varieties as Magna Charta, Anna Alexieff, Mrs. John Laing, Heinrich Schultheis, and Gen. Jacqueminot should be well ripened by withholding water and getting the wood good and solid, with the eyes fairly prominent. At no time during the procress of ripening should the wood have been allowed to shrivel.

Presuming that the plants have been properly treated and are now in condition to prune, the first thing to look for is a good, plump, prominent eye; to this each shoot should be cut back, the weaker ones shorter and the strong ones proportionately longer, cutting away all useless spray and unripened wood, so as to give those left all the room possible to develop their foliage and buds. As soon as the pruning is done, clean off all rubbish and slightly loosen the surface of the soil, then spread thinly over the surface a dressing of pure fine ground bone, covering the same with a liberal dressing of good manure mixed with about one-third fresh soil, the whole thoroughly mixed before covering up the bone. Give the whole a liberal syringing to settle it, then if any of the shoots need tying or bending down it should be done at once, after which keep giving a little more water each day until the whole soil, whether in pots, boxes or benches, is thoroughly moistened. Then keep the house at 40° to 42° at night, with fire heat for the first 14 days, and 60° to 65° by day, giving plenty of air. Syringe the plants overhead morning and evening. Should any of the plants show signs of drying out at the root, give them enough water to keep the soil nice and moist, but not over wet.

After about two weeks of such treatment the eyes will begin to swell quite prominently. As soon as they have done so increase the night temperature to 44° or 46°, and continue raising the same 2 or 3° every two weeks till the buds are all set, which will generally be in from seven to eight weeks, by which time the average night temperature will have reached 52°; after this the thermometer should be kept as near 56° at night as possible, with an average day temperature of 62° without sun, and with bright sun the thermometer can be allowed to run up to 75°, providing there is plenty of air on at the same time. They should be liberally syringed on all occasions till the buds begin to show color, after which it should be discontinued altogether.

As soon as the buds are all set, weak, clear liquid manure can be applied every few days as required, which will increase the size of the buds, but this should also be discontinued as soon as the buds are half developed and a somewhat dryer atmosphere maintained until they are all cut.

For later crops the plants can remain

unpruned until it is required to start them, when the same treatment as above can be applied to them, only that the drying process is not so essential to ripening them, as the colder days, now fast approaching, will naturally rest them better than any artificial means.

TEA ROSES.

These will still need the same care and attention as per recent notes; and, as the days shorten, even greater care will be required in regard to water and fire heat, both of which should be sparingly applied. Where mildew still persists in showing itself, apply sulphur in the form of thick paint to the pipes when hot enough to cause fumes to diffuse through the whole house; this will effectually kill it. JOHN N. MAY.

Our Telephone.

"Hello, Central! give us Mr. E. V. Hallock, of Queens, N. Y."

"Go ahead."

"Good morning, Mr. Hallock. What about your specialties this year? Have you anything interesting or instructive to tell us?"

"Well, we have been harvesting our gladioluses. You can imagine that this is no small job when I tell you that we have 27 or 28 acres of ground devoted to the culture of gladioluses and 20 men and boys have been engaged in digging and storing the bulbs.

"Last year we cleaned and stored 50 barrels of the little bulblets alone. The bulblets are sown and the large bulbs planted in rows. We have a plan in cultivating which may be new to some of your readers. When planting the bulbs we cover them with a ridge of earth slightly deeper than is necessary. About the time they are beginning to sprout we go over them lightly and quickly with a hoe, removing the surplus ridge of earth, thus disturbing it enough to kill the young weeds and saving the labor of one weeding of the rows.

"As the bulbs come into flower we follow them up, putting on each as it blooms true to name a little twist of wire. In this work alone we use about 12 stone of wire each season."

"What is your experience with the gladioluses as a market flower in summer?"

"Well, I don't think it would pay to give much attention to growing it for cut flowers. During the past summer we have frequently sent in as many as 5,000 spikes a day to the market, but they have been selling very low. Possibly a good late crop might be made to pay. From the 2d to 6th of July is as late as it is safe to plant them for fall blooming, and only the largest and finest bulbs should be reserved for this purpose. The smaller the bulb the earlier it should be planted to obtain a flower and to insure another good bulb in the fall.

"Montbretias may yet be of some value for cut flowers. I believe they will yet attain great popularity. They can be forced easily. Crocosmiæflora is about the best we have as yet."

"What is your experience with the Lemoine hybrids?"

"My impression is that they will never attain the popularity of the old species. Their only point of superiority is their intense coloring. A bad point about them is the hardness of the stalk, which prevents their opening the buds well in water after being cut, as the ordinary gladiolus does."

"Have you ever attempted any systematic hybridizing of gladioluses with a view to obtaining new varieties?"

"No, we just plant them together and save the seed. With such enormous quantities as we are growing we stand about as good a chance of striking valuable ones as if we hybridized carefully."

"Do you import any gladioluses?"

"No. There are very few imported nowadays. On the contrary, we are beginning to have large export orders. Gladioluses, in my opinion, will take the same course as tuberoses did. Europe is 'not in it' with us in growing gladioluses.

"We are much pleased with our success with pyrethrums this year. The general impression is that our climate is too dry and hot for them. Now we have just passed through one of the worst seasons we could possibly have. From the middle of April to July we have had scarcely any rain, yet our pyrethrums are in splendid shape, and we have not lost a plant. If the soil is deeply and finely worked they will do. They should always be transplanted and the roots divided about the middle of September. By this means the stock will be about trebled annually.

"Pyrethrums are hard to ship. If the crowns get a little heated they are gone. Many are thus lost in coming to this country from the other side. The single varieties seed rapidly, and they are very pretty, but the double ones are the standard and these are very difficult to seed. April and May is their blooming time, and the flowers of the double white and double bright rose sell well in the cut flower market."

"Is anybody in this country hybridizing pyrethrums?"

"Not that I know of, but I believe it would pay somebody to go into it."

"Have you any information of interest regarding any other of your specialties?"

"I will only add that single dahlias seem to have 'lost their grip,' and that canna 'Star of '91' will give great satisfaction as a pot plant."

MR. NORTON AT THE TELEPHONE.

"Hello, Central! Connect us with Horticultural Hall, Boston. We would like to talk with Mr. P. Norton, chairman of the committee of arrangements of the Mass. Hort. Society."

"Here he is. Go ahead."

"Mr. Norton, we would like to have you tell the readers of the FLORIST something about managing horticultural exhibitions."

"Don't ask me. You've got the wrong man. Try somebody that knows something about it. Why don't you wait until we see how the chrysanthemum show comes out, and then perhaps I'll talk to you."

"Well, so far as we can learn, the exhibitions at Boston have prospered exceedingly under your management, and this being the time of year when there are exhibitions everywhere, we feel confident that you can give us something of value to our readers, especially those who are interested in exhibitions, but who have had little experience in that direction. For instance, do you think it wise to offer prizes, the payment of which is unprovided for excepting in the prospective receipts from the show?"

"No, sir. Decidedly no. If you have no organization back of you strong enough to guarantee the payment of the premiums without regard to the show, go slow. Better a prize of $1 paid as agreed than $20 in a broken promise. Never disappoint your exhibitors by making promises that you cannot with certainty fulfill."

"How would you raise money in advance, provided there was no responsible horticultural society interested?"

"Well, about the only thing to do is to resort to a 'guarantee fund.' Especially will this be necessary at first, but with good management a standing fund should soon accumulate that would be sufficient."

"What do you consider the best course to pursue to interest the public and secure a large attendance at floral exhibitions?"

"Judicious advertising, of course. And in connection with this you want to secure the co-operation of the press. They are always ready, I find, to give their support to a worthy cause, if properly approached. See that they have the details of your plans well in advance; that they have an abundant supply of complimentary tickets; and during the time of the show see that they have all the attention and assistance possible in reporting the displays properly. To turn a reporter loose in a horticultural exhibition without a guide who is well posted on the names and the merits of the different exhibits is equal cruelty to the reporter and his readers. Another important point I would mention is a low admission fee. Just at present there is in Boston a food and health exhibition. It is wonderfully successful and the attendance is something remarkable. I attribute this largely to the low price of admission, 25 cents. If it were 50 cents they would get scarcely anybody; 25 cents is in my opinion as much as we should ever charge to admit to a horticultural show. In addition to this, I would advocate free admission at certain hours for the school children. This could be arranged through the school committees. By doing so you are not only implanting a knowledge and love of flowers in the minds of the children, and helping to lay the foundation for future attractive homes, but you will also find, I think, that the immediate interest in your enterprise will be greatly enhanced, and the public attendance largely increased. Get the women and children interested and you are safe.

"Of course, one of the principal factors in making a successful exhibition is to see that it is a meritorious one. But by all means have something which you can advertise that will appeal to the popular fancy for novelties. The 'Baby Flower,' the 'Century Plant,' the 'Holy Ghost Flower,' the 'Night-Blooming Cereus,' things which people have heard and read about, and in regard to which they have some curiosity; such things are 'leaders,' as was Jumbo in Barnum's circus, and to be successful nowadays with any kind of a show you must have your Jumbo in one form or another. It is a good plan to advertise special attractions for each day. The best day we had at our chrysanthemum show at Boston last year was a rainy day, when the attendance would naturally be light, but we had advertised it as 'Ladies' Day,' and that did the business for us. Good music is also a necessary adjunct to a floral exhibition. There are few attractions offered now for public patronage in which music is not given a prominent part and the floral exhibitions must keep up with the procession. Music and flowers, it will be conceded, make a good combination, and I believe the increased receipts will in most cases offset the additional expense."

"What is your experience regarding the comparative acceptability of money or plate as premiums to exhibitors?"

"Well, to the young beginner, whose resources are small, of course money is most acceptable, because of necessity.

VIEWS AT WASHINGTON PARK, CHICAGO, FROM PHOTOGRAPHS TAKEN THE PAST SUMMER.

But as a general thing cups or medals are more of a stimulus, and when won are a source of pride, especially to the gardeners' wives, who like to show their treas ures to visitors and to whose homes they add an attractive ornament. It is also a big advantage to a gardener changing his place to have such evidences of his skill to carry with him. It is a wonder to me that private gardeners do not exhibit more than they do. Everything is in their favor. They get most of the glory and their employers pay the bills incurred in producing fine plants. The advertising which a gardener gets by being a successful exhibitor is more than most of them are aware of. Look at Mr. Manda, for example. Would he ever have attained that reputation which opened the way for him to his present commanding position if he had not made his abilities known through the medium of exhibitions. I doubt it.

"On no account should exhibitors be permitted to advertise their business on the exhibition cards. Nothing should be allowed thereon except the name and address. The non-observance of this rule creates a fearful amount of jealousy. By all means keep 'shop' out of your exhibitions."

"How about the arrangement of exhibits in the hall? Can you give us any advice about that?"

"Ah, there's the trouble. You can tell nothing about it till you know what is

coming, and the gardeners don't like to tell their intentions lest their competitors should find it out. So they hold back until the last moment. But it would be much better for everybody if they would let the chairman of the committee know beforehand what they propose to exhibit.

"For the exhibition of cut flowers we have found tables about 2½ feet in height, covered with white cloth or paper, to be the most suitable. We have found nothing better in which to arrange them than the clear glass vases which we have had made specially for our use. In shape they are somewhat similar to the 'Tye's Pattern' hyacinth glass, only that the neck is considerably narrower and taller in proportion. The white paper as a background shows off the colors of most flowers much better than does the green moss which is sometimes used to bank them in. Rhododendrons, however, with their own foliage look better in the moss.

"The final awards on cut flowers should not be made until the closing day. Exhibitors should be required to keep their displays fresh by renewals every day or second day during the continuance of the show. We have adopted this rule not only with flowers, but with vegetables and fruit, and we find that it works well. It keeps up the rivalry and insures a presentable exhibition to the last moment.

"All premiums should be open to general competition, and not confined to members of the society. Stringent rules regarding the removal of any plants or flowers from the hall except under the supervision of some responsible person are very important.

"One thing you cannot have too much of in managing horticultural exhibitions is system. The secretary should keep a list of all exhibitors, whether prize takers or not, as well as a full record of what they show, and to accomplish this all intending exhibitors should be required to furnish to the secretary a complete list of all their exhibits. The record will be found almost indispensable next year when making preparations for another show. The less fortunate ones this year may be the prize winners next year, and you want to know them all. When you find it desirable to get people together to consult regarding special prizes, etc., you know whom to send for."

"Do you think that the arrangement of exhibits should be left entirely to individual contributors?"

"Well, arranging a hall for convenience in judging and for general effect are two entirely different things. It is my opinion that we should make a great advance in our exhibitions if after the judging had been done the hall should be put into the hands of a competent committee, who should have full power to arrange the display for effect. Some of the plants under such an arrangement would scarcely be recognized, even by their owners. Now, I would just like to say one word more, and then I am through. We want a good label holder that can be used to fasten labels quickly and securely to vases and dishes, and hold them in convenient position for reading. There is a good chance for somebody to turn his ingenuity to a practical and profitable use."

WHEN writing to advertisers please mention the fact that you were induced to write by the advertisement in the AMERICAN FLORIST. You will benefit us by letting advertisers know that it is the FLORIST that is bringing them trade.

New York.

Mr. Thomas W. Weathered has just returned from a visit to England, where he has been spending the summer.

Burns & Raynor are removing to larger and more convenient quarters at 49 West Twenty-eighth street.

Mr. August Rolker sailed on the steamer Fulda on October 24, for a trip to Genoa. He hopes to return completely restored to health.

Chrysanthemums are coming in too fast. Gloriosum is badly overstocked. This and other cheap varieties have been sold as low as $30 per 1,000 sprays. Roses and carnations are beginning to feel the effect of the chrysanthemums. Violets and valley, however, are scarce and in brisk demand. The supply is entirely inadequate. Smilax is badly overstocked. Cusins are very fine and Wabans are improving. Some very fine Hostes are coming in. Some of the growers are talking up a scheme of selling flowers at auction. Whether it will result in any action is doubtful. It would be a novel idea and worth trying, if somebody is willing to take a risk.

The auction sales during the past week have been very successful. M. Louise violets have sold for $14, $15 to $20 per 100. A lot of cycas plants were sent in with a certain limit set upon them. They brought double the limit. A pthychosperma that was passed by on Tuesday at $5 brought $31 on Friday, and a seaforthia which could not get a bidder on Tuesday at $3 brought on Friday $17. But this is only an instance of the "phenomena of auction sales," as Robt. Young would say.

It is asserted that a determined effort is to be made to popularize the Cape Jessamine in New York the coming season.

Charles Thorley's refrigerator is the ideal arrangement for a well-kept florists' establishment. The devices for maintaining a moist atmosphere by the constant dripping of water are excellent, and the spotless tiles with which the walls and floor are lined, together with the arrangements for electric lighting, are calculated to show off the flowers to very best advantage.

The first meeting of the season of the Torrey Botanical Club was held at Columbia College on the evening of October 13. Dr. Thomas Morong gave an interesting account of his investigations of the vegetable growth in fresh water ponds in the vicinity of New York. There has been found within an area of 60 miles no less than 47 distinct species. After some further legislation, which is to be acted upon next winter, it is expected that the proposed plan for a botanic garden at Pelham Bay Park will be successfully carried through. Assurances of substantial support from men of means have been received.

At V. H. Hallock & Son's there is a splendid stock of Eulalia gracillimum univittatum. This most effective grass is not commonly known here yet. It is not quite so tall as E. Japonica, and the flower plumes are a little better than in that species. The foliage is exceedingly graceful, equal, in fact, to that of Dracæna indivisa. Introduced by Lemoine.

Whatever prejudice may exist in one's mind against artificial flowers is apt to be largely dispelled by an examination of this year's importation by Rolker of metal and porcelain memorial designs. The imitations of natural flowers are wonderfully lifelike, and their arrangement in many of the designs is most artistic. It is a rare thing to see fresh flowers put together with so much taste, and many of our florists could learn a valuable lesson in artistic arrangement from some of these artificial productions.

The New York *Herald* for October 18 contains a two column contribution upon the history of the chrysanthemum and the purposes of the managers of the coming exhibition at Madison Square Garden, interspersed with more or less lifelike portraits of Messrs. John Thorpe, W. A. Manda, A. Ladenburg, A. S. Burns, John H. Taylor, J. R. Pitcher, J. W. Morrisey, and T. H. Spaulding. It is quite a good paper, and will go a long way toward interesting the public in the show. But just fancy the figuring that will be done on the strength of the following statement: "A single chrysanthemum plant produces from 150 to 200 blossoms. Good varieties bring $25 per 100 wholesale." More proof of the rapid accumulation of wealth by the florists!

The New York *News*, in a recent article, outdoes the *Herald*, however. It represents a "Broadway florist" as saying: "The flowering jacquimot, which generally is barren of much bloom, has surpassed some of the other less important roses. I think the weather has had a great deal to do with this growth among the flowers." It then quotes thus from another "successful florist:" "Our trade is much like the grocery business. When certain products are scarce and prices go up, what little stock we happen to have we make profit on; when the same articles are plenty everybody can afford to buy them, and by selling quantities we make as good a margin. So no matter which way the wind blows the florist is usually on the safe side." Happy man!

Further on the scribe gets bolder, and launches out on his own hook, without the quotation marks. Here is how he succeeds: "Mrs. Wm. Astor, who has for many years had a striking penchant for chrysanthemums, had a modest bunch of the *Golden Lady Alpheus Hardy* upon her chatelaine belt." Strikingly modest that was! Another society lady's favorite corsage is given as "three large chrysanthemums, two purple asters, one white rosebud, and two small cream-colored dahlias." As if to apologize for the lady's extravagance, he adds: "She is a stately woman, and can carry to perfection a queenly amount of ornamentation." After all this we are prepared not to be surprised at the further information that at a certain reception last *August* a lady wore a "gown elegantly trimmed with rows of *orange daffodils*." Next!

Philadelphia.

The regular monthly meeting of the Pennsylvania Horticultural Society was held October 20. As the annual meeting takes place next month, the following gentlemen were nominated for election at that time: For president, Geo. W. Childs; for vice-presidents, four to be elected, Robert Craig, George W. Earle, W. A. Reed, M. D., Chas. H. Miller, Robert P. Harris, M. D.; recording secretary, D. D. L. Farson; corresponding secretary, Edwin Lonsdale; treasurer, W. H. Smith.

The names of John Bardsley and H. H. Kennedy were dropped from the rolls, as these gentlemen, heretofore prominent in business circles, are now serving sentences in prison of fifteen and ten years respectively for defrauding the city out of large sums of money.

The coming chrysanthemum show received a great deal of attention and the various committees reported that everything pointed to a great exhibition. Bus-

iness the past week has been spasmodic; one day very good, the next very little doing. Flowers are plenty with the quality getting better every day.

Anderson is cutting some very fine Albanys and La France. Harris is sending in some specimen flowers of Ivory and Eldorado chrysanthemums with long stems. He was very unfortunate in losing nearly all his seedlings of this year. In the hurry of last Easter the little plants in the seed bed did not receive the attention they required and damped off. This lot would no doubt have turned out some fine varieties, as the flowers from which the seed was taken were hybridized with great care. He has some seedlings carried over from last year which promise very well.

We note with pleasure that the Washington florists have the "market" problem under serious consideration. A wholesale market for cut flowers is bound to come in every large city; it only wants united action on the part of a few large growers to start it; started, it is sure to be a success and everybody will wonder how they ever managed to get along before.

Your New York correspondent is in error when he says that the Florists' Bowling Club of Philadelphia challenged the New York club. It was the other way, as the Philadelphia boys received the challenge and accepted it. The matches will take place as reported.

Anderson is rolling in great shape at present, he having broken two records the past week. The first was for three games, making 559 pins, an average of 186⅓ to a game; the second was on Thursday last in a match, when in the first game he made 246 pins.

Hugh M. Hughes leaves Philadelphia on Saturday, Oct. 24, for Chicago, where he has secured a position as assistant to Mr. R. Ulrich, Superintendent of Landscape Department of the World's Columbian Exposition. He should be well qualified for the work, as he was for many years with his father, who served under the celebrated landscape gardener, Milver, of London, and who had charge of the large estate of John Platt, Esq., in North Wales. After he came to this country he was for several years first assistant to his brother, Jno. M. Hughes, at "Wootton," the country place of Geo. W. Childs, Esq. After leaving "Wootton" he took entire charge of the grounds (300 acres) and greenhouses of E. DeV. Morrell, Esq., Torresdale, Pa., to the entire satisfaction of his employer. He carries with him from Philadelphia the best wishes of his many friends.

Boston.

The activity in the cut flower trade still continues. Lily of the valley is in very general demand and is hard to obtain in quantity. Violets are scarce; many more could be sold if they could be procured. Roses sell well at prices slightly advanced. Carnations if of good quality sell rapidly from $1.50 to $2 per 100. The finest box of white carnations seen here this season was a lot of Lamborns sent in by a Maine grower. Chrysanthemums are very abundant; the quality is uniformly good. Specimen blooms on long, strong stems are coming in freely.

At the Nobscot greenhouses, South Sudbury, where Jas. Tulis is gardener, there is a house of over 2,000 Grace Wilders, which are remarkably fine and healthy. There are 10,000 of Mrs. Fisher being grown there also, besides Florence, Silver Spray and Hector, all of which look vigorous and promising.

The annual free distribution of the surplus plants at the city greenhouses took place on October 20; 50,000 plants and about 400 baskets of loam was the amount thus disposed of, the recipients being mostly women and children, and many a humble home will be made brighter this winter in consequence.

It is a most encouraging indication of the increasing popularity of plant decorations to see the very general use of palms and decorative plants in connection with the various exhibits at the great "Food and Health" exposition at Mechanics Hall this week. Very few of the stands are lacking in ornamentation of this sort, and in many of them considerable money has evidently been expended for plants.

It is said that Mr. P. Welch, the wholesale florist, is about to follow the good example set for him by his two brothers and thus there will soon be another Mrs. Welch.

Chicago.

The meeting of the Florist Club held last Thursday evening was one of the largest in the history of the club. The room was crowded and the "standing room only" sign was in order early in the evening.

After the preliminary routine business had been disposed of Mr. Wm. Kirkham read a paper on the chrysanthemum, an extract from which appears on another page, together with a synopsis of the discussion that followed.

Two applicants were elected to membership and as three were elected at the previous meeting the membership list is still steadily growing.

This was the annual meeting, and officers for the ensuing year were elected as follows: G. L. Grant, Pres.; Joseph Curran, Vice Pres.; F. F. Benthey, Sec'y; P. J. Hauswirth, Financial Sec'y; E. Weinhoeber, Treas., being a re-election in each case and by acclamation.

The club by vote authorized the president to subscribe $200 to the guarantee fund of the Horticultural Society to insure the payment of premiums and other expenses incidental to the coming exhibition of the society. The society has a fund of $1000 already subscribed and proposes to considerably increase it so that in case of a shortage through unfavorable weather during exhibition week or other causes the percentage for each guarantor to pay will be small.

Each member was given a bundle of advertising placards as he left the meeting and the city is now pretty well decorated.

Fourteen members participated in the adjourned session and some fearful and wonderful scores were made. Mr. McAdams, who raised his score to 240 two weeks before, cancelled the 2 on this occasion and didn't seem to be at all proud. One of the boys who was making his first attempt made bushels of fun by getting his ball into the gutter when less than six feet down the alley. He accumulated a most gorgeous string of "poodles."

The ladies selected to act as judges of floral arrangements at the exhibition are responding favorably to the invitations sent them and the committee promises to be a large one. In their acceptances each one of the ladies expresses appreciation of the compliment to her taste implied by the invitation and their friends will undoubtedly all hear about the exhibition without delay.

The market continues quite brisk, but the supply is better than last week. There is no longer such a scramble for stuff as there was the week previous. Stock is by no means over plenty though and really good stuff finds a ready sale. Am. Beauties are scarce and the quality rather poor. Carnations are very good and fairly plentiful, except white, which are scarce. Chrysanthemums are coming in more freely and meet with a ready demand. Common flowers sell at wholesale for $3 and $4, good stock at $5 to $6 and fancy from $10 to $15. Violets are reported by the growers as very backward and in most places looking poor. The outlook for this favorite flower is not very bright. Bouvardia also is rather slow in coming forward. Callas in small quantities and a few camellias are making their appearance.

Frank Benthey is displaying some splendid chrysanthemum blooms in his window. They are from plants grown to single stem and flower and the largest of them sell for 50 cents each, the remainder bringing 25 cents each. Among the sorts displayed in his window last Monday were specimens of Alcyon, 8 inches in diameter; Mrs. Frank Clinton, 6 inches; Mme. F. Cariel, 5; John Thorpe, 8; Mrs. Hicks Arnold, 4; Mme. C. Carrier, 6; Domination, 6½; Shasta, 5; Gorgeous, 4½; Walter W. Coles, 6½. Also large blooms of Ed. Andre, Louis Boehmer and other sorts. They were certainly remarkably handsome blooms for the season, and as Frank has not lost a bloom yet he feels pretty well satisfied in spite of the fact that at the last meeting of the Florist Club some were inclined to think he had made a bad bargain in contracting for these flowers. But as he has got to take the whole crop he is not inclined to congratulate himself much until he sees how great his losses will be later when the glut is on.

Mr. John Thorpe has been quite under the weather of late from an attack of rheumatism. He was confined to the house for some time last week and though again at his desk he is looking far from well.

Toronto.

Our genial friend, Mr. F. G. Foster, of Hamilton, accompanied by Mr. S. Aylett, gardener to Senator Sandford, also of Hamilton, were in attendance at the last regular meeting of the Gardeners' and Florists' Club.

Mr. John Chambers is at present taking a well earned holiday somewhere in the wilds of Wayback shooting deer and smaller game.

Florists are increasing in this city to an alarming extent, no less than three being reported during the last month as having been presented to their respective parents.

The club has ordered 200 of the beautiful lithographs published by the Courier Litho. Co. of Buffalo for advertising chrysanthemum shows. These lithographs are finely executed and will no doubt have a large sale.

Mr. Chas. Arnold will take charge of the flower booth at the chrysanthemum show this year.

A medal has been presented for competition by an unknown gentleman for the best collection (25 plants) of chrysanthemums grown in six-inch pots or smaller.

A few chrysanthemums may now be seen in the city stores, mostly Gloriosum. All outdoor flowers are things of the past now—10 degrees of frost this morning (23rd), the lowest yet. Leaves falling in showers.

The club has had to pay a large sum for the use of the Horticultural Pavilion for the 12th of November (Thanksgiving

day), some other parties having engaged it ahead for a concert. However being a holiday it is hoped that nothing will be lost, but something gained. We do not intend to be caught napping again and have already engaged the pavilion for the second week of November, 1892. Five ladies will judge the design work at the coming show. E.

News Notes.

WORCESTER, MASS.—H. B. Watts & Son have opened a retail store at 545 Main street.

BAY CITY, MICH.—The dates for the chrysanthemum show have been changed to November 16 to 21.

MACOMB, ILL.—Pillsbury & Gessler are building a new greenhouse 80x20, to be use mainly for growing cut flowers.

YPSILANTI, MICH.—The greenhouses of the late L. E. Childs have been leased by his widow to Mr. Chas. Kyrke, who has succeeded to the business.

OTTAWA, ONT.—The Gardeners' and Florists' Club of this city are considering the matter of arranging for an annual exhibition of plants and flowers.

NEW HAVEN, CONN.—The New Haven Chrysanthemum Club has decided upon November 10, 11 and 12 as the dates for the coming chrysanthemum show.

ST. JOSEPH, MO.—Mr. Hans Neilson has been ill with typhoid fever for the last three weeks. He is now slowly recovering, though still unable to attend to business.

WILMINGTON, DEL.—The florists of this city, in connection with the Junior Board of the Homeopathic Hospital of Delaware, will hold a chrysanthemum show November 12, 13 and 14.

HARTFORD, CONN.—The Hartford County Hort. Society has postponed the chrysanthemum show one week. It will be held November 9 to 11 instead of 3 to 5, as previously announced.

GALT, ONT.—The Galt Horticultural Society has changed the dates for the chrysanthemum show from November 11 and 12 to the 10th and 11th on account of an engagement of the hall on the 12th for another purpose.

ATLANTA, GA.—At the meeting of the Atlanta Horticultural Society on the 14th inst. President Gould told what he knew about the chrysanthemum to an interested audience. The society decided to make an exhibit at the Piedmont Exposition.

HAMILTON, ONT.—At the annual meeting of the Gardeners' and Florists' Club, held on the 20th inst., officers for the coming year were elected as follows: Samuel Aylett, Pres.; J. W. Fox, Vice-Pres.; F. G. Foster, Treas.; H. Brown, Sec'y (re-elected).

BAY CITY, MICH.—The railroads have made excursion rates to this city for the time of the chrysanthemum show and it is expected that crowds will come from all over the state. The excursion rate from Detroit is only $2 and as the exhibition there comes earlier we expect visitors from that city.

PITTSBURG.—At the meeting of the Pittsburg and Allegheny Florists' on the 13th inst. it was decided to make the price of admission to the coming exhibition 25 cents for adults and 15 cents for children. One of the best orchestras in the city has been engaged to supply the music for the occasion. The committees are all hard at work and the outlook for a successful show is very bright.

TOLEDO, OHIO.—The barn, stable and carriage house of George A. Heinl on Cherry street were destroyed by fire on the night of October 16 together with one greenhouse and contents. The horses and delivery wagons were with great difficulty saved and but for the very prompt response of the fire department great loss to stock would have resulted, as the barns were joined on to the greenhouses. Loss about $600, fully covered by insurance. Cause unknown.

LOUISVILLE, KY.—An elaborate wedding decoration was recently arranged by Nanz & Neuner. The whole house was decorated with American Beauty roses and asparagus vines. Over 800 Beauties and 300 strings of asparagus were used. The church was decorated with fine palms and large vases of American Beauty roses. The bride carried a bouquet of lily of the valley. At the house the roses were arranged in tall vases, 25 in each vase, and placed all over the house. The mantels were banked with American Beauties also. It was pronounced one of the finest decorations ever seen in this city.

DALLAS, TEXAS.—The display in the Floricultural Department of the recent state fair was very creditable. Premiums to the amount of $556 were awarded and 2,500 square feet of space was filled with plants and flowers. In the open to all classes the majority of the first premiums were taken by J. M. Howell, the florist of this city, and in the amateur classes by Mrs. J. F. Metcalf. The Texas State Horticultural Society will meet in this city July 20 to 22, 1892. Mr. J. M. Howell is president. The horticulturists of Texas are preparing to make a creditable display at the World's Fair at Chicago in '93.

Miscellaneous Plant Notes.

BY WM. FALCONER.

CANNAS FOR WINTER BLOOMING.—Mr. J. T. Temple, of Davenport, Iowa, writes me: "I have a large bed of cannas in a greenhouse for winter blooming; have 50 Star of '91 and 50 Mme. Crozy in it. But I prefer the Star, as it blooms on smaller plants and more freely than Mme. Crozy. With callas, poinsettias and other plants of this sort, I think they will be fine for Christmas decorations.

ROSES VS. SOMETHING ELSE.—Mr. Temple also writes: "Roses are pets of mine, but when they sell for 35 to 50 cents per dozen, retail, as I saw them sold in Chicago last January, it will take a long time to get rich at that rate, so we have got to search around for something else. * * * I think you struck a keynote when describing the beautiful first premium mantel decoration made by David Allan at Boston last year, when you mentioned that there wasn't a rose in it.

BERRY-BEARING PLANTS.—Mr. Temple has got them on the brain. But he is as sound in the head as he is solid in the flesh. It was only last year he sold pot plants of Callicarpa purpurea in ripe fruit for $5 each, and he declared to me they really looked so pretty he didn't care much to part with them even at that price! Now he has got another subject, and he writes: "Did you know that

"THE NIGHT-BLOOMING JESSAMINE (Cestrum Parqui) makes a good berry-bearing plant? I had a plant bloom profusely last year, and it was covered all over with small white berries from December to June, kept in a cool greenhouse." Yes, I used to grow it. And about eleven years ago my old friend, the late Mr. Greenlaw, of Boston, when he saw it laden with ivory berries declared it to be one of the handsomest and most unique things he had ever seen in the way of a greenhouse plant, and was delighted to get some cuttings. But although it is an old plant, it has never met with the approval it deserves. Although its flowers are sweet-scented, they are not showy, and it comes of a race which has very ill-smelling leaves. Mr. Temple does not know whether he has made an

"ORIGINAL DISCOVERY or not. But some three years ago I noticed that Clematis Jackmanii produced more blossoms at the top of the trellis than near the bottom of it, and the most flowers of all were produced on the suspending branches falling from the top of the trellis down again to near the ground. So I made a trellis with a bracket on each post and two wires on top and 7 feet high, and planted the vines against the trellis, and when they got to the top they drooped over from the wires strung across the brackets, and you ought to see the sight! Cobæa scandens, maurandias, Clematis Jackmanii, C. coccinea, Solanum jasminoides, etc., have more than double the amount of bloom that other vines of the same sorts and trained straight up as far as they will climb have. It is about on the same principle as taking a wistaria vine and training it to a pole, allowing the side branches to hang down again; these suspending branches will bloom far more fully than those kept straight up. I am going to try it on grape-vines."

"CLEMATIS PANICULATA.—What a grand thing this is for the retail florist for decorating! I cut some sprays 8 feet long covered profusely the whole length with its sweet-scented white flowers, placed the ends of them in a bottle of water, and they lasted six days. It ought to be better known;" and Mr. Temple continues:

"BOEHMERIA NIVEA, or Chinese nettle, makes a fine decorative plant when planted out on the lawn in summer. Not hardy.

"HYPERICUM CALYCINUM grown as a pot plant is a good thing, and very useful at Easter. Although generally considered a hardy herbaceous perennial or partly shrubby plant, in the north its hardiness is precarious, and although it may survive the winter well enough under a mulching, it is most useful to me as a pot plant.

"ANTHERICUM LILIASTRUM major is a fine, hardy perennial, useful for the florist or amateur for early summer flowers. It is locally but erroneously known in this locality as 'squills.'

"AN OPEN-HABITED late-blooming golden rod is very well spoken of as a companion plant to Desmodium penduliflorum, as it blooms at the same time and has much the same graceful flowering form." But the commonness and weediness of golden rod in general militate against their favor for garden use, no matter how beautiful the species may be

PETUNIA HYBRIDA GRANDIFLORA var. SUPERBISSIMA, from California.—Mrs. Ella Gould, of Ventura, sends me flowers and photographs of some of her petunias. The blossoms are 5½ to 6 inches wide, beating our Glen Cove blooms of the same variety by an inch. Mrs. Gould is an enthusiast in the matter of petunias and devotes much attention to intercrossing the different varieties.

SITUATIONS, WANTS, FOR SALE.

Advertisements under this head will be inserted at the rate of 10 cents a line (seven words) each insertion. Cash must accompany order. Plant advs. not admitted under this head.

SITUATION WANTED—By a young man, single, on either private or commercial place. Good references. Address G L, care Am. Florist.

SITUATION WANTED—By a German, middle aged, single and sober, some experience, want work in greenhouses only. Address F K, Springfield, Ohio.

SITUATION WANTED—By an experienced mushroom grower, none than a good position wanted, or will take a partner to go into the business. Address H B, care American Florist, Chicago.

SITUATION WANTED—By a florist and propagator; first-class landscape gardener; German, single, age 38; 20 years' experience. Address HENRY HELLER, 2219 Larimer St, Denver, Colo.

SITUATION WANTED—Jan. 1st or after, by young man thoroughly experienced in experimental gardening, including knowledge of notes, records, descriptions and classifications. Good references. F. A. WAUGH, 722 W. 8th St., Topeka, Kan.

SITUATION WANTED—Thorough, practical English gardener seeks engagement with a good florist or private family; well up in landscape work, and highly recommended. Address PRIDEAUX, 2½ Melrose St., Lawrence, Mass.

SITUATION WANTED—By young man, single; well up in growing roses, carnations, bulbs and general run of florist stock; good at forcing and propagating. Good references; western states preferred. VICKERY, 2 24 Ames Ave., Omaha, Neb.

SITUATION WANTED—German, aged 28, married, no family, 14 years' experience (10 in Germany), would like situation in florist's establishment, or could take charge of same; good references. Address F. SCHMIDT, care M. Dummett, Mt. Vernon, N Y

SITUATION WANTED—By a thorough practical florist and gardener. 20 years' experience, 6 years in last situation; fully competent to take charge of a first-class private or commercial place; good references. Address C H, care American Florist, Chicago.

SITUATION WANTED—By a practical gardener as manager of private or public grounds or large commercial plant; thorough knowledge of all branches; a successful hybridizer of orchids; unexcelled in palms, stove plants, roses, cut flowers, grapes, etc.; rockery and landscape gardening; 20 years' experience; unexceptional references; sober; married, with small family; only first class position desired. Address BOTANIST, Niagara St., Pittsburg, Pa.

WANTED—Florists to send their wholesale price lists to Secretary Maple Hill Floral and Nursery Co., Danville, Ill.

WANTED—Assistant in commercial place of about 4,000 ft of glass; one who understands growing general greenhouse stock; or will lease to good man. J. R. SHAVER, Charleston, W. Va.

WANTED—A competent man to grow roses, carnations, bulbs, and general stock of plants. Good references required. State terms, age, married or single. None but competent men should apply. JOHN RECK, Bridgeport, Conn.

WANTED—For our floral department a young man who has had several years' experience in selling and making up cut flowers. Must come well recommended. Apply by letter, stating age and experience. BROWN, THOMSON & CO., Hartford, Conn.

FOR SALE—Greenhouse business at Austin, Ill., cheap. Reason for selling, poor health. Address JOS. SHAW, Austin, Ill.

FOR SALE—A first-class retail florist business, palm greenhouse attached and well stocked with fine salable palms. Owner giving good reason for selling. Address W. M. HAYES, care Ellison & Kuehn, 1122 Pine St., St. Louis, Mo.

FOR SALE—Well established seed business. The North Star Seed Store and St. Paul Wire Works having been carried on together, and each having grown to such importance as to need my personal attention, I offer for sale the seed department at a bargain and on easy terms to a reliable party. The business is not confined to seeds but is supplemented with trees, plants, garden tools, stable fixtures, birds, gold fish, poultry supplies, etc., etc. the sales of which extend through the whole year. Long established; widely advertised; favorably known; centrally located, and with the seed buying community in a prosperous condition makes this a chance seldom offered. Bona fide buyers, address DE COU & Co., 21 W. 3rd St., St. Paul, Minn.

WANTED.

Assistant in commercial place of about 4,000 feet of glass; one who understands growing general greenhouse stock, and garden and nursery work, and can help lay glass and hot water pipes. Single man with good habits and recommendations, only need apply. Wages $25 per month and board. Address OTTO SCHUCHT, Sheboygan, Wis.

TO GARDENERS AND FLORISTS.

ADVERTISING THE EXHIBITIONS.

The Horticultural Society of Chicago has through its advertising committee prepared the newspaper advertisements which it will use during exhibition week and is having them put into type by a job printer and a hundred copies run off. The plan of having the advs. printed on slips in advance was first undertaken simply on account of the convenience in being able to at leisure have the displaying of the matter properly done for the papers to follow and in having a number of copies as the various papers must of course be given copy simultaneously and the cost of making a dozen or fifteen written copies almost equals that of having the type set. And again there is no chance for errors in the printed copies as there would be with the written ones. But the society has thought of another purpose to which these slips may be put. Enough extra copies have been printed so that the society can send a set to each of the other organizations giving exhibitions. And this will be done, with a request for proofs of the advs. prepared by the others and thus secure the benefit of the advertising ideas of all giving the matter thought.

We believe that this is an excellent move and would recommend that other organizations adopt the plan of having their advs. printed in advance on slips, so that the exchange may be general. That such exchange would be mutually beneficial none can doubt. If each society originated one good advertising phrase all would then have 30 or more good ones to work with. We are all working in a common cause and should fully utilize every opportunity to assist each other.

SEVERAL DOZEN blooms of the new rose, Madame Pierre Guillott, have been sent us by Messrs. C. Strauss & Co., Washington, D. C. It is certainly a most beautiful rose and possesses the qualities that will make it very popular with flower buyers. It is in the way of Mme. de Watteville, but apparently a decided improvement upon that variety, and we are assured by a number of growers who have tried the rose that it is very profitable from the growers' standpoint as well as a quick seller over the counter. One thing is certain, such blooms as those sent us will never lack a purchaser at a fair price so long as there are buyers in the market.

THE Bay County Horticultural Society, of Bay City, Mich , announces that owing to the backwardness of the chrysanthemums it has postponed its exhibition until November 16 to 21. This exhibition is being very liberally advertised and barring unfavorable weather or other unavoidable cause this, the first exhibition of the kind held in Bay City, will undoubtedly be the success its promoters anticipate. And from the amount of work done the fullest success is certainly deserved.

C. J. PENNOCK, "The Pines," Kennett Square, Pa., writes that he has dropped the "Mammoth" from the name of his new white seedling carnation for the sake of brevity, and not on account of any diminution in the size of the flowers. It will hereafter be called the "Pearl."

WHEN sending out premium lists, mail copies to the secretaries of other organizations giving exhibitions. Each organization should have the benefit of the ideas of all the others. See addresses of secretaries in our list of coming exhibitions.

SOME very excellent tuberous begonia flowers were received from Messrs. Brauer & Richter, McConnellsville, O., on the 21st inst. They were of very pleasing shades, of good substance, and the petals of some of the flowers were frilled.

WATCH our list of coming exhibitions. The changes recorded in this issue are almost as numerous and radical as last week.

REMOVAL.

BURNS & RAYNOR,

Wholesale Florists,

HAVE REMOVED TO

49 West 28th Street, NEW YORK,

where they will have larger store space and better facilities for their rapidly increasing business. Their method of **Shipping Roses** has given them a large out of town trade and for good flowers, especially **Beauties** and **large Mums** the above address is **Recognized Headquarters.**

The Seed Trade.

AM. SEED TRADE ASSOCIATION.

F. BARTELDES, Lawrence, Kan., president; A. L. DON, New York, secretary and treasurer. The tenth annual meeting at Hartford, Conn., second Tuesday in June, 1892. Applications for membership should be addressed to Wm. Meggatt, chairman membership committee, Wethersfield, Conn.

The Vick Failure.

Walter S. Hubbell, on behalf of P. M. French, receiver of James Vick, seedsman, made an application to Judge Davy this morning for permission to sell and rent certain portions of the property. The application reads in substance as follows:

"Your petitioner shows that the assets which have come into his hands as such receiver consist largely of seeds, bulbs, growing plants and property of a perishable nature. That your petitioner, under an order heretofore made in this action, has since his appointment as receiver been filling orders received by mail where such orders were accompanied by the necessary funds to pay for; that a large amount of the property now in your petitioner's hands consisting of property upon which much time and money must be expended, not only to preserve the same, but to cultivate and propagate the same for market in the spring. That your petitioner's pay roll amounts to about $500 per week.

"That in your petitioner's judgment it is not for the best interest of the creditors or the stockholders of the defendant for your petitioner to continue the business of said corporation during the winter. That either or all, or practically all, of the said assets, excepting the real estate, must necessarily be sold at once, or your petitioner must continue said business during the winter, for the reason that a large amount of the property consists of growing plants, etc., which must be put into hot houses, taken care of during the winter and used for propagating plants in the spring, the same being of no value for any other purpose. That the expense of running the hot-houses on the property of the said defendant during the winter is large, and your petitioner does not feel justified in incurring the expense, or even in asking authority from the court of incurring the expense of so doing. That there was due upon the first mortgage upon the real estate the sum of $875 on the 14th day of September last, said mortgage being held by the Mutual Life Insurance Company, of New York. That an annuity of $2,000 a year to the widow of James Vick, deceased, is secured upon a second lien upon real estate, and there are taxes due the city of Rochester upon said real estate. That in case your petitioner can lease said real estate, or a part of it, your petitioner thinks he can sell to any person leasing the same quite an amount of said personal property, and that the rental of the said real estate will pay the interest on said $35,000 mortgage and the said taxes or a portion thereof until spring and that by so leasing all or a part of said real estate your petitioner can realize a considerable sum from a sale of personal property which would otherwise be wasted, but that in order to do so your petitioner will be obliged to apply the amount received from the rental of the real estate for said time upon said incumbrances, or some of them.

"And your petitioner further shows, as he is informed and verily believes, that the value of seeds is largely a matter of personal confidence in the integrity and skill of the seller. That for this reason the purchaser will not buy unless the person from whom he buys is a well-known dealer, and also unless such dealer can certify as to the quality of the seeds sold, so that in the hands of your petitioner said seeds are of much less value than they would be in the hands of those who grew the same, or had personal knowledge in regard to the same.

"Your petitioner further shows that whatever is done in regard to the leasing of any portion of said real estate or of the personal property above referred to which is perishable, or which cannot be sold until next spring, must be done quickly, for the reason that when a heavy frost comes it will be too late for a purchaser to save a portion of said property, and for this reason a short notice of the sale of the personal property should be directed by the court to be given."

Judge Davy was in some doubt as to the advisability of leasing any of the property. He thought immediate measures should be taken to dispose of it an once. He reserved his decision until to morrow morning.—*Rochester (N. Y.) Post-Express, October 12.*

PORTER M. FRENCH, receiver of Jas. Vick, seedsman, advertises to sell most of the personal property of that corporation, including lists of names, stocks of seeds and bulbs and Vick's Magazine, etc. October 27.

W. H. SMITH, seedsman at Philadelphia, has sold out to Mr. B. C. Halfield, of Lancaster, Pa., who will continue at the same place, 1018 Market street.

MR. W. ATLEE BURPEE is having such serious trouble with his eyes that his physicians say he must have absolute quiet for a while.

W. B. HAYT, representing the Cleveland Seed Co., sailed from New York on the 28th for a three month's trip in Europe.

WARM October weather in Germany is likely to make shipments of lily of the valley later than usual this year.

THE Emerson Seed Co., of Omaha, Nebraska, are reported to have sold out their retail business.

The Cyclamen.

This old favorite florist's flower has not received as much attention of late years as some of its more fortunate brethren, such as carnations, chrysanthemums, etc., but we do not despair of seeing it taken in hand by some "specialist" and its good qualities developed. Perhaps it will be said that such would have occurred ere now had the plant given promise of reasonable success. To such we would say that we consider the following characteristics worthy of further improvement, viz: Distinctness of form of flower, variety of color varying from the purest white to the deepest tinge of crimson, easiness of culture and time of flowering, viz; From end of September till May. It also makes a good window plant, not being too large, and in such a situation with ordinary attention will continue in flower as stated above. We have had most success with seed sown in October, which by about the turn of the year will need "pricking out" into boxes of nice light soil. We prefer boxes here, although in England the favorite way of the large growers is to put from four to six round the edge of a 4-inch pot and get them up pretty near the glass. By March the little plants will have from three to five leaves; they must then be given more room, always using nice light open soil that will not "solid." They must be kept shaded from the sun in spring and summer, but when housed for the winter they will stand all the sunshine they can get if they are placed on a cool "bottom," although the flowers will last longer when moderately shaded. Occasional watering with weak manure water during the flowering period will help them provided they have not too much pot room, when it will have a tendency to cause too much leaf growth. I.

WISCONSIN FLOWER EXCHANGE,
93 Mason Street, Milwaukee, Wis.

An Historic Plant.

Cattleya labiata vera has after a lengthy period again been rediscovered. Brought to this country in 1818, nearly all of the original plants came from the importation of 1818.

It has often been remarked that this was the first cattleya that ever came to Europe, but Messrs. Loddiges, of Hackney, England, had already introduced Cattleya Loddigesii, known in those days as Epidendrum Loddigesii. It certainly is a grand orchid, and takes first rank among this most beautiful family.

They show a wide variation, and pure white forms are among the new importations, and four and sometimes five blossoms appear on a spike. The original plants have in every respect given the true characteristic of this plant, i. e., that it is very robust and a free bloomer, and the main point is that its flowers appear during October and November, a season when cattleya blooms are somewhat rare and always in demand.

How many plants of this autumn flowering cattleya there were when it first made its appearance we are not told, but one found its way into Mr. Cattley's collection at Barrett, England and bloomed there, and the flowers were afterward sent to the great Lindley, and the genus from that time was named in his (Cattley's) honor.

PLEASE mention the AMERICAN FLORIST every time you write to an advertiser in these columns.

In magnificent order and condition of the True and Historical

CATTLEYA LABIATA AUTUMNALIS VERA

Rediscovered by

F. SANDER, ST. ALBANS,

GUARANTEED THE OLD LABIATA OF LINDLEY.

The Queen of Cattleyas. A valuable and most useful Orchid for the florist. Blooms in October and November on **4, 5 and 6 FLOWERED SPIKES.**
PLENTY of WHITE are among them.

Form and Coloring Superb, embracing White, Rose Purple, Red, Maroon, Crimson and Yellow.

500 PLANTS OF THE ELEPHANT MOTH DENDROBE

In Grand Condition.

Dendrobium phalænopsis var. Schroderianum,

THE KING OF DENDROBES.

Only seven plants in cultivation. Very easy to grow. Unlike any Dendrobium phalænopsis variety. Flower spikes 2 feet long, ranging from white to rose purple; it is even finer for cutting purposes than O. Alexandræ, and even surpasses that grand orchid for brilliancy of color.

The above will be offered at AUCTION by

R. B. YOUNG & CO.,

205 Greenwich Street, NEW YORK,

FRIDAY, NOVEMBER 6TH, NEXT.

Visitors to the Madison Square Show should not fail to attend this most important sale. Plants on exhibition day before sale. Catalogues had on application.

The One Judge Plan.

Now that the exhibition season is at hand I wish to repeat the advice I offered last season to managers of exhibitions to select one competent man to act as judge instead of three or more, as is usually done. Among many notices in favor of this method I remember the flollowing: Mr. Foster at the meeting of delegates of florists' clubs at Toronto said: "In Toronto they have adopted the system of one judge and although at first I objected to it vehemently I now approve of it. It is in my opinion *the* system." "E." writing from Toronto in the FLORIST for October 15 says: "The Gardener's and Florist's Club have adopted the one judge system for their coming chrysanthemum show. There was no difficulty about that: the trouble seems to be to get the one judge who will be suitable." The secretary of a society in this state (Pa.) where I judged the display of plants and flowers, says in a letter to me: "We adopted the one judge plan several years ago and find it far superior to the three or more plan."

If one judge cannot do the work in the time allotted get two, not to work together, but let each take a class and award the prizes in it and then go to another, each man being responsible for his own work.

I wish also to again urge the managers of flower shows to set chrysanthemums and all tall plants on the floor. By doing so you not only make it possible for judges and visitors to see the flowers on them, but save the cost of benches and the time required to erect them. W. T. BELL.

Franklin, Pa.

Choice Plants Cheap

Vaporizing Tobacco Juice.

I have read many articles in the FLORIST on the subject of vaporizing tobacco juice for killing green-fly. I have no doubt this can be successfully done by those using steam. I would like to know if any of the readers of the FLORIST who are using hot water have been able to vaporize tobacco successfully. For the last two years I have succeeded in keeping my houses free from green-fly by placing tobacco stems upon the hot water pipes, but this method requires large quantities of stems, which are sometimes difficult to get. I have no doubt many who like myself are using hot water, would be glad to know if tobacco water can be successfully vaporized without the aid of steam. J. H. ELLIS.

Exhibiting Chrysanthemum Flowers.

I think 100 or 200 blooms are too many to be called for in one class. It seems to me that the prizes offered are not commensurate with the great sacrifices needed on the part of the grower to get together such a large number of really first class flowers.

I also believe that each flower should be shown in a separate vase and that two large blooms should not be jammed together in one vase or cup as I have seen them at some shows. W. K.

WHEN GETTING up letter heads for your club or society do not fail to give the street address as well as the name of the secretary. We note that several clubs have failed to supply this convenience to correspondents on their letter heads. Be sure to supply this deficiency in the next lot you print and if you haven't time to write the address in on the present lot get a rubber stamp made and stamp it in. Make communication with your organization just as easy as possible.

If you wish to illustrate your Printing with Cuts, send 10 cents for my Catalogue of FLORAL ELECTROS 2,250 Engravings.

A. BLANC, PHILADELPHIA.

The New Boy.

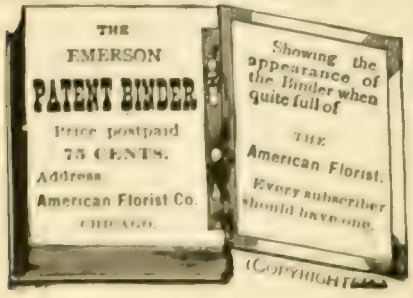
It happened in pot washing time. Out under a big tree they all sat on boxes around a large tub of water and among them was the new boy who was taking his first lessons in washing pots. His seat on the hard box was not exactly comfortable and as the hours flew on the box seemed to get harder and harder.

So when one of the men was called away to take the air off some of the houses his nice soft cushion composed of a neatly folded cardigan jacket proved too much of a temptation for the new boy, who at once transferred it to his own seat and chuckled with comfort. Up on the roof of the adjacent greenhouse were straddled a couple of painters, one of whom also enjoyed the luxury of a cardigan jacket as a seat. And it looked just like the other jacket as its corners hung down between the sash bars.

The very leaves seemed hushed with awe as the owner of jacket No. 1 returned to his seat and in thundering tones demanded his jacket. The new boy looked unmoved and quietly pointed over his shoulder with his thumb to where the innocent painter was at work.

"You sneaking thief, throw down that cardigan jacket or I'll come up there and snake you off that greenhouse!" The painter's answer was not exactly polite and cannot with propriety be recorded. Presto! A lightning spring and the next instant a confused mass of arms and legs was whirling in the path, while the air was blue with sulphurous remarks. After the dust had cleared away there was left a very badly dilapidated gardener and an equally disfigured painter, each clutching a piece of woolen rag. The new boy in the meantime had disappeared.

THE Courier Lithographing Co., of Buffalo, has gotten up a most elaborate lithographed poster in colors, full sheet size, bearing the words "Grand Chrysanthemum Show and Floral Exhibition," over a ground of chrysanthemum flowers excellently done in color. Space is left at top and bottom for printing in the name of the society and the place and date of the exhibition. It is a splendid advertising poster, and can be used by any exhibition.



YOU MAY THINK

you know all about it, but do you? The use of **LONG'S FLORAL PHOTOGRAPHS** while taking orders of your customers will do more for you over and again than you might think. A trial is convincing to any enterprising florist. Circular list with prices, free.

JARDINIERES IN GREAT VARIETY.

NOTE.—Our new Catalogue for the Fall of 1891, containing illustrations of New Jardinieres especially adapted for Standard Pots is now ready and will be sent on application.

A. H. HEWS & CO., CAMBRIDGE, MASS.

AHEAD OF EVERYTHING.

We Follow None, Prize or No Prize.

Our latest improvements in machinery produce a Standard Pot which for lightness, smoothness and durability, has never been equaled. Customers buying of us will

SAVE ONE-THIRD IN FREIGHT.

And to prove this, we give below a table showing number in Crate and WEIGHT of same, which speaks for itself:

Size.	No. in Crate.	Weight.
1¾-inch	3,000	250 lbs.
2 "	2 400	250 "
2¼ "	1,750	250 "
2½ "	1,450	250 "
3 "	1,280	350 "
3½ "	800	350 "
4 "	600	350 "

It will be seen at a glance, that our pots are one-third lighter than formerly, and yet we claim that owing to the superior quality of our clay and improved machinery, they are stronger than any pot in the market, and we frankly ask you to make the test. ☞ SEND FOR PRICES.

American Carnation Society.

REPORT OF COMMITTEE.

It is a matter of regret that the committee appointed to pass judgment on the carnations exhibited at the inauguration of the American Carnation Society were not able to make a report at the first meeting, but we were overtaken by darkness. It was our judgment that all the carnations shown possessed some of the qualities which recommend them to the trade, namely: Color, form, stem, habit and fragrance.

Among the dark crimsons that were shown were the J. R. Freeman, Anna Webb and Pride of Kennett. In the same class we noted with pleasure two seedlings exhibited by Mr. McGowan under the numbers 122 and 125, both equally good as to shape and stiffness of stems, the former, however being the larger, and the latter possessing a richness of color seldom seen in carnations.

Among the yellows shown was a beautiful flower of Golden Gate, Louise Porsch much lighter than Golden Gate, shading very prettily to white on the edges and streaked with light crimson. If the stems were a little stronger it is our judgment that it would be a valuable addition.

We have never seen finer specimens of the carnation Dawn. These were exhibited by Mr. Chitty. This gentleman also exhibited fifteen other vases of carnation flowers.

A bunch of unusually fine Tidal Waves was shown. In this same class of color a new carnation named Thomas Cartledge and undoubtedly possessing merit was shown by Mr. Edward Swayne. Fine large specimens of William F. Dreer were exhibited.

Mr. Christian Eisele exhibited a sport of Century in pots. Its habit appears to be identical with its parent, it being very prolific, and looks as though it would prove a valuable commercial variety; color, dark crimson. The same gentleman showed some fine plants of Silver Spray.

Among the scarlets were Fred Dorner, which is unusually large. Good specimens of Portia and Constancy were shown.

Mrs. Fawcett, a salmon pink: The stems of this variety were particularly strong; likely to prove a valuable addition. Grace Wilder was shown in good condition.

Aurora, by Edward Swayne, shows merit; a trifle lighter than the Grace Wilder, a step we think in the right direction. Its fragrance was also pronounced and delightful. Anna Wiegand, also of the same type as Grace Wilder. Day Break, exhibited by Albert Herr, originated by W. P. Simmons & Co. These carnations we understood had been cut a number of days. The darkest colored ones were a beautiful shade of light pink.

Among the whites we noticed Lizzie McGowan and Lamborn, both of which were excellent specimens and were well grown. Mr. McGowan exhibited a carnation under the number 103 the same type as Dawn, a little more delicate in coloring, however. No. 108 was a scarlet showing great merit. No. 111 was a white of merit. Mr. McGowan exhibited several others, but unfortunately without any name or number whereby we could designate them. From this gentleman's exhibit we should say that he fully appreciates the value of good long stiff stems. J. G. Burrows also had a seedling carnation on exhibition. The American Flag, the sport from Portia, was also shown.

We did not give so much attention to the fragrance, as our time was so limited we found it impossible.

As the members of this committee are all retail florists and as our point of view is slightly different from that of the growers we deem it not out of place at this time to offer a few suggestions.

First, when the American Carnation Society shall adopt rules of judging carnations at exhibitions that one of these rules be that they shall be judged by day light. We would also strongly advise that a stenographer accompany the committee of awards to aid them in their report.

As one means of stimulating the interest in carnations we would advise that the growers when shipping flowers should frequently put tags with the names of the carnations written on. In this way the salesmen will become familiar with them. Having this knowledge a new interest will come and it will not be long before customers will call for carnations by name, as they now do for roses.

We would call your attention to the fact that more careful packing would be advisable; also, when practicable, to ship foliage with carnations. This we find is much appreciated. The day for selling flowers without their *own foliage* has gone by.

Our ideal carnation has the following qualities:

Form: Diameter as great as possible, petals as large as possible, not too double for two reasons; they are apt to burst the calyx and to our mind, when each petal is large and distinct, the flower is much handsomer and more graceful. The center petals should stand erect, thus avoiding a flatness sometimes seen.

Color: White, which is now called for more than any color, should be as pure

as possible. Pink, undoubtedly next in demand, should not be too dark. It is our judgment that a carnation lighter than a well grown Grace Wilder is much more desirable than one that is darker. A very delicate pink we find can be used or arranged with a greater number of contrasting colors than a dark pink. As an example, a dark crimson carnation with a very delicate or pale shade of pink is pleasing, while a dark crimson and a carnation several shades darker than Grace Wilder would generally offend people of refined taste. There is a slight difference of opinion as to the difference in value of dark crimson and scarlet, but we agree upon the following points: If a scarlet, let it be as pure and brilliant as possible, and if a crimson, it should have depth of color and if possible the velvety texture noted in No. 125 exhibited by Mr. McGowan. The Chester Pride is a valuable type, but we hope to see an improvement on this good variety. We would call your attention to the necessity of developing the yellow carnation. Flowers of this color possessing all of the good qualities would be of great value.

Stems: These should be *strong*, holding the flowers erect, and *long* enough to arrange a cluster of fifty or more gracefully in a vase.

Fragrance: A very important feature. Should never be forgotten as "the perfume from flowers and shrubs is as grateful to the one sense as their color and conformation are to the other."

Habit: Under this heading there are so many things to be considered that we are hardly in the position to give any suggestion to the grower, although we are confident that the time is not far distant when the American Carnation Society will endorse certain new varieties. This once done the retailer need have no doubts about the merits of that particular variety.

Fuchsias.

Mr. W. F. Bassett asks on page 1012 (August 6 issue) how fuchsias may be kept over winter without special trouble.

If the wood of the plants is sufficiently ripened in the fall so that the leaves will drop off naturally he need have no trouble if the plants are kept comparatively dry at the root in a frost-proof cellar, and at a temperature below the growing point.

Mr. Bassett does not say what the plants are needed for. If for spring sales there is no real necessity for carrying stock over, only a sufficient quantity to produce the necessary number of green cuttings, as they make by far the better plants.

Beautiful, symmetrical plants can be raised from soft cuttings and had in bloom in a few months from the time the cuttings are rooted. Fuchsias, to do credit to the cultivator, must have care from the start.

Some 20 years ago, just for fun, I undertook to grow a few specimen fuchsias, and what was done more for pleasure than prospective gain, turned out to be quite profitable, for the plants which had received rational treatment sold the most readily and at much better prices.

The cuttings were taken from old plants that had been growing in a night temperature, more often 50° than higher, consequently they were sturdy and in good health. The cuttings were from 2 to 4 inches long. The time of year was the first week in January. A few of the lower leaves were trimmed off the cuttings. After this preparation they were inserted directly into small pots. The soil used was light, rich, and porous. They were placed in bottom heat, and kept shaded and sprinkled until they were nicely rooted. All that we had to do was to keep them from wilting.

As soon as the little plants were rooted they were moved to a more airy, cooler, and lighter situation. Here they remained until they were well established, —that is to say, nicely rooted. They were stocky plants by this time, and here is where the radical treatment is practiced which tends to develop the fuchsia in its natural graceful proportions.

The strongest plants and the most vigorous growers were repotted into 8-inch pots, and the weaker ones were transferred to 5-inch pots, the majority being put into 6's and 7's. The pots were well crocked and the soil used was good rich loam. The temperature maintained was from 50° to 55° at night, with plenty of air during the daytime. As the plants progressed one stake was placed to each one, and carefully tied thereto.

By this big-shift system the plant sprouted and developed uniformly all over—that is, according to the variety.

Some varieties are naturally of a pyramidal style of growth, while others are not so well disposed. Pinching or stopping the young growth is never resorted to in order to induce a dwarf or bushy habit. The ample space accorded through the large pot and the generous root room accomplished this much more effectively and naturally than any process of training could possibly do.

Flower buds made their appearance in due time on the leading shoot. These were carefully nipped off until they appeared on all the shoots of the plant. This allowed them all to have a fair show, and an elegant plant was the result.

The variety, as indicated before, has much to do with the shapely plant, and also its time of flowering. The sorts which I grew may not be in the trade today, or may be supplanted by better varieties.

A great favorite of mine at that time for early work was Arabella or Mrs. Marshall. It had a white tube and sepals and pink corolla. Bianca marginata was also one of the light colored kinds and early, its tube and sepals were white, the corolla delicate pink. The edge of each petal forming the corolla was of a much lighter shade, giving this sort a very unique appearance. Lustre was also good. It had a bright red corolla, approaching scarlet. Elm City was a great favorite in those days. The corolla was double, of a purple color, the sepals and tube were red. Prince Imperial, Maori Chief (catalogued by some as Modoc Chief), and Bernice all have single purple corollas; the plants were of the correct shape. Wave of Life had yellow foliage and single purple corolla. Avalanche (E. G. Henderson & Co.) also had yellow foliage, but it was a stronger grower than Wave of Life, and the purple corolla was double.

Personally I prefer the single fuchsia flowers to the double ones. A bachelor friend once cynically suggested the only reason for that could be because I was once single myself!

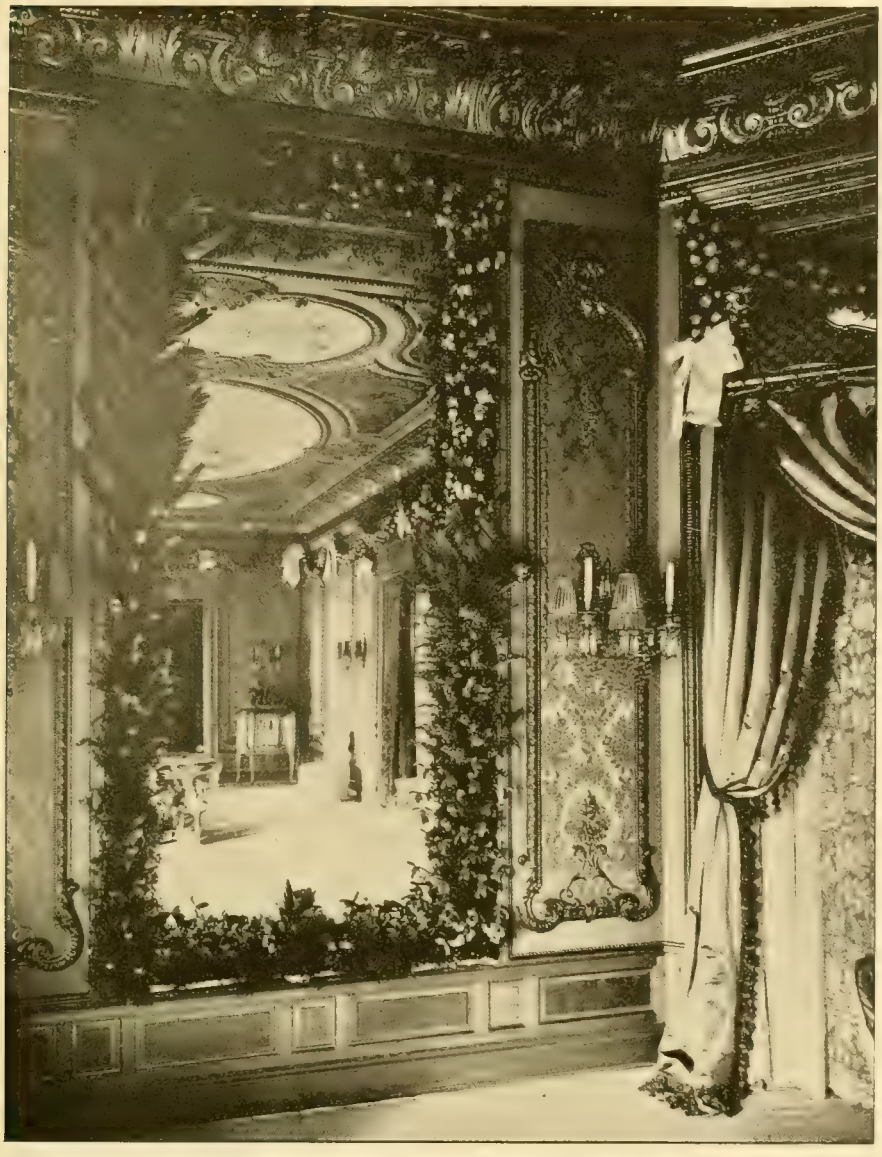
Avalanche (Smith). Both these came out the same year, if I am not mistaken, hence the identity of the name. The latter had a double white corolla streaked with red and pink. Old Rose of Castile was still grown at that time; the corolla was single and purple in color. The Lord Beaconsfield was out about that time or a little later. I remember exhibiting it at a local horticultural show as a new plant, but the committee on awards refused to recognize it as such, declaring it was nothing but old Speciosa! It certainly does resemble that old sort in color of the flower. It is single, corolla bright red, tube and sepals blush or delicate salmon pink. In the nomenclature of colors it is preferable to say salmon rather than shrimp pink. A shrimp has to be boiled before it approaches a pink in color, whereas a salmon is naturally pink; besides, the latter has always been used in describing that peculiar shade of pink in floriculture, and shrimp is a comparatively recent introduction, having been brought in with dress or ribbon goods.

A variety of fuchsia which has been largely grown in recent years for spring sales is one known as Black Prince, but how it came by that name is hard to understand, for there is nothing suggestive of darkness either in foliage or flowers. It is a profuse and early bloomer, and I have reasons to believe it is a good grower. It ought to make a beautiful specimen under the course of culture laid down.

In conclusion, fuchsias make an excellent display at a spring flower show. If cuttings were started now, and brought along slowly, what magnificent plants they would make by next April, large enough for a 12-inch pot. The early varieties would, of course, have to be selected for that purpose. EDWIN LONSDALE.

P. S.—If Mr. Bassett wants smaller plants, say for market or home spring sales, it is not necessary to put cuttings in before February or March. For the mailing trade of catalogue men the ripened and rested plants would be, perhaps, the most suitable. I have not seen a well-grown fuchsia for a number of years. It is about time they were taken in hand again and pressed nearer to the front. A finely-grown fuchsia would made an excellent subject for an illustration for catalogues. E. L.

Wedding Decoration.



We present herewith two engravings from photographs of the decorations arranged by Messrs. A. M. & J. B. Murdoch of Pittsburg, for the wedding of the daughter of Mr. Robert Pitcairn of that city.

One illustration shows the large mirror at one end of the Pitcairn drawing-room, framed with small cycas leaves, sarracenia pipes, cypripediums, erica and bougainvil'ea.

Heavy garlands of La France roses, caught up by broad light blue shaded ribbons, were hung around the three sides of the room as can be seen in the reflection of the mirror. Baskets of La France were placed on cabinets and mantel shelf and in fireplace. On two pedestals placed to the right and left of the mirror were two large gold baskets filled with La France and trimmed with blue ribbons.

The other engraving shows the bridal table. The table, eleven feet in diameter, was covered to within fifteen inches of the edge by the design, made in nine parts, the center a circle having a stand on which was placed the large gold epergne filled with Bride roses. Around the base of this was first a row of adiantums, next to it a circle of lily of the valley. Around this were grouped the eight pieces forming the circle, two filled with adiantums, with stand on which rested the candelabra, the other six filled with Bride roses.

The second dining room table consisted

MIRROR AND ROOM DECORATION FOR WEDDING.

of an arrangement of ferns from the center of which rose a cluster of Anthurium Andreanum. At each corner of the table hearts of Bennett roses were placed.

The hall was decorated with yellow chrysanthemums in large Japanese vases and on staircase and screen. Over the musicians yellow tarletan and smilax were draped with good effect. In the parlor opposite the drawing-room large Doulton vases were filled and the mantel banked with American Beauties, while a beautiful cluster of entwined branches arranged on a flat basket covered with mosses, ferns and orchids, was placed on a center table.

The bride's bouquet of orchids was arranged in the spray shape tied with narrow ribbon with many long ends (at least a dozen). The ends were all tipped with lilies of the valley and on five of the long ends were sewed lilies of the valley the entire length of the ribbons.

At the church the pulpit was banked with plants. At either side were placed one of Jansen's new white celluloid pedestals surmounted by white baskets filled with large yellow chrysanthemums. Clusters of chrysanthemums were tied on ends of pews and a rope of the same flower thown across the aisle marked the reserved pews.

Ericas.

BY HENRY T. CLINKABERRY.

[*A paper read before the New Jersey Social Florists' Club.*]

The heath family is in recent years a very much neglected class of plants, which is a fact to be regretted, first because it is a very beautiful family, and secondly because I believe that wherever ericas were grown well that was the place to teach our young practitioners the proper use of the watering can, how to ventilate a greenhouse and how not to; it also gave them an idea of another equally important matter, how to pot a plant neatly. Thus heath growing helped to teach a young gardener three very important features of an horticultural life, to water with care, to know how to ventilate, in accordance with the weather, and to pot a plant in a neat and workmanlike way.

It may be well to say that our subject is one of our oldest cultivated hard wooded plants, and during the reign of George III ericas were in such favor as to command special attention from him, he having twice sent a collector named Masson to the Cape of Good Hope in search of them. To Masson is due the credit of bringing over to Europe most of the species and varieties now in cultivation, exception only being taken to some dozen or so hybrids which were raised by those notable gardeners of the past, Dean Herbert, of hybridizing fame, Turnbull and Marnock.

Some four hundred or more species have from time to time been introduced, but many of them have been lost to cultivation, so that it may be safe to assert that at this time we probably cannot muster more than two hundred or two hundred and fifty kinds. in fact one of the most complete collections known to me does not contain probably any more than one hundred and fifty or one hundred and sixty distinct kinds.

The erica is generally grown in a house specially adapted to its requirements, although it does not necessarily require one solely to itself, many other genera growing well with it, notably all those plants known to gardeners as New Holland plants. The houses should be span-roofed and run north and south, if possible; size is best left to the cultivator's requirements, although I should like to suggest one about twenty feet in width, twelve feet to ridge and six feet high at the sides. It should be built with movable sashes that may be entirely removed during the summer and early fall months and replaced with water proof canvas of a light texture (I prefer this to placing them out of doors for reasons which will be given later). The sides from the stages upward should be hinged so that in all suitable weather abundance of fresh air may be admitted to the plants and the side walls should be so built as to admit of sliding shutters being placed at intervals around the house on a level with the hot water pipes. The house of such dimensions as I propose would allow four-foot side tables, a center table of six feet and a three-foot pathway. If possible it will be best to have a slate staging and never use any gravel on the benches, as the moisture it gives off is very apt to generate mildew, the only disease heaths are subject to.

Having our house ready it is well we should select our plants, and I think the following kinds are the most suitable: Aitonia, Turnbullii, ampullacea, Austiniana, Candolleana, Cavendishii, cerinthoides, coronata, depressa, exquisita, Eweriana, jubata, rubra, jasminiflora alba, Marnockii, Lambertiana rosea, Parmentieriana rosea, Paxtonii, retorta major, Shannonii, all the varieties of tricolor, Turnbullii, the whole of the ventricosas and Victoria. The above are all strictly hard-wooded. The following list is softer in wood and comprises what are usually designated market heaths, hundreds of thousands of which are annually grown in England for market purposes and of which there seems never too many: Foremost of these come Erica hyemalis, gracilis, autumnalis and gracilis vernalis, persoluta alba and the ventricosa varieties. If the whole of the varieties mentioned are grown you will have some in flower all the year round.

It now remains for me to give a few simple cultural directions. First, the soil in which to grow them; this should be composed of three parts peat and one part sharp river sand. In mentioning peat it may be well to state that the best is what we consider refuse or screenings from orchid peat. Always be careful that the plant does not require watering when newly potted; knock it out of the pot and carefully remove the crocks, except

when the plant is large, when they should be allowed to remain, owing to the mass of root fibre around them. Always use new pots, if possible, as they are a good guide in watering through the first time and put ample crocks in the drainage. Set your plant in the new pot to ascertain how much soil will be required between the crocks and the ball; it is wise to do this as ericas must never be repotted any deeper, care being taken to keep the old ball on the level with the new soil. Finally with your potting stick proceed to make the soil very firm around it, ramming it down well, and smooth off the surface. The plant will not require any water for three or four days, then it should be well soaked; usually it requires to be filled up three times. Your new pot will show when it is wet through.

The erica is not one of the easiest things to propagate, still if you are careful you can strike them successfully. June and July are the best months to propagate them. In selecting your cutting take off the new side growth with a heel; the cutting should be about an inch long. Carefully trim off the leaves about one-third and the heel with a sharp penknife. Procure the necessary pots filled one-third with broken crocks and soil as used for the plants and an inch of fine sand on top and water well before you insert your cuttings; when drained proceed to dibble in your cuttings, leaving a margin of one inch to support the rim of a bell glass. Gently water again through a very fine rose and when tolerably dry place your glass over and keep close in a cool house which can be shaded from the sun. Care must be taken to wipe out your bell glass every morning and never let your sand become quite dry. In about three months the cuttings will be rooted, when the glasses can be gradually removed, first taking them off over night and replacing them again during the day for a week or two.

In March or April they can be potted off into small pots and when they commence to root in the new pots pinch out the extreme point and shift them on as their pots fill with roots until in five or six-inch pots. Bear in mind to never repot heaths until the pots are well filled with roots; never let them droop, as they are practically dead if they do. Always ascertain when to water by ringing the pot and be careful the ball is wetted thoroughly. Specimen plants will not require shifting but once in four or five years.

In conclusion I predict that those varieties, which for the lack of a better term I have called market kinds, will soon be included among our indispensable American florists' plants, blooming as they do during our festive season. These kinds are best grown out of doors from June till September and should be plunged in nursery beds of ashes or some other suitable material; they should be in their flowering pots by April or May at the latest and they are much benefitted by an occasional dose of weak guano water. Never smoke them and should mildew be troublesome dust with sulphur. Should any stock remain unsold after flowering they should be cut back to within one inch of the previous year's growth and potted on in larger sized pots and treated as before. It must be understood pinching and cutting back only applies to the soft wooded kinds.

Fern Notes.

Some of the stronger growing ferns may be used to advantage when filling conservatories, as well as for window plants and in order to have them in good condition for such use they should not be too heavily shaded, else the fronds will not stand the exposure.

To grow plants suitable for this class of decoration is not difficult, nor does it cost much, for they may be shifted on as required into five or six-inch pots during the summer, the latter size being quite large enough to be useful, and thus may occupy space that otherwise might be empty for the time being.

Several of the pteris are especially good for this purpose, from the fact that their growth is rapid and reproduction very easy, P. tremula, P. argyræa, P. serrulata cristata major and P. quadriaurita being among the best of this genus for use as large plants.

The nephrolepis also include several good examples, among them being N. exaltata, N. tuberosa (this having some resemblance to N. exaltata, though not so broad-leaved) and N. davallioides furcans, the latter being one of the handsomest and also one of the hardiest of the genus.

These three nephrolepis will flourish under cool treatment and make admirable window plants, the bright green of their long and graceful fronds being particularly attractive.

Dicksonia cicutaria, also known as Sitilobium cicutarium, is another fine fern for a large specimen, in fact is better suited for such use than for small ferneries, as its fronds soon become too tall for the latter use.

Some of the aspidiums too may be included in the present list, notably A. falcatum, perhaps more easily recognized under its older name of Cyrtomium falcatum, a remarkably handsome fern when well grown, but soon ruined by thrips when grown in too high a temperature; also some of the many forms of A. angulare, these being nearly or quite hardy. Nephrodium Sieboldi is another bold-leaved sort that is good for a contrast and is also best when grown cool.

Nephrodium Richardsii multifida may be grown in either a warm or cool fernery, the latter condition being best if the plants are required for decorative purposes.

A pleasing addition may also be made to a conservatory by the use of some ferns in baskets, many species being well adapted for this method of culture, and provided the baskets are not allowed to suffer for want of water the plants will keep in good condition for a long time.

Where the circumstances will permit some of the adiantums may be used in this way with charming effect, A. assimile being a good species for this purpose (though of no special value as a pot plant), its rhizomes soon spreading through a basket and producing an abundance of fronds.

A. dolabriforme is also an excellent species for basket use, its pinnate fronds being narrow and long and proliferous at the tips, the latter peculiarity making it an easy one to increase and also specially adapting it for basket culture.

A. ciliatum is of similar habit to the preceding, though very distinct in appearance, and also makes a fine basket, but is somewhat more tender than A. dolabriforme and therefore is not so well adapted for trade use.

Platycerium alcicorne will do well under this treatment and soon covers a basket with its oddly formed fronds, both barren and fertile, and always attracts much attention.

Among the tree ferns Dicksonia antarctica is probably the most satisfactory for conservatory decoration, being the hardiest of the arborescent species, and usually presenting fronds of sufficiently moderate size that they do not interfere with the arrangement of a small house, as might be the case with some of the larger growing species.

If, however, the space at command will permit, there are many other ferns of this character that will flourish in the average conservatory, among them being Alsophila australis, A. excelsa, Dicksonia Schiedii, Cyathea medullaris and C. dealbata, all of which are noble species and suitable for cool house culture.

W. H. TAPLIN.

Chrysanthemum Show at Short Hills, N. J.

Messrs. Pitcher & Manda, with characteristic enterprise, have started the chrysanthemum ball a-rolling, being first in the field with a splendid exhibition.

Among the chrysanthemums the prime attraction is the new hairy one, W. A. Manda. Its color is a deep, rich yellow, and in habit, shape of flower, etc. it is first class. Another notable variety is the improved Mrs. Alpheus Hardy. This is a vigorous growing variety with full deep flowers, in which the hairy filaments are much longer and more abundant than in the old variety. It is in every respect apparently a great advance on the original.

Quite a number of last year's seedlings are very fine. Hicks Arnold, yellow, is seen in many trained plants and standards, one of the latter measuring 7 feet across. Harry May is one of the best, color coppery yellow, flower very full and high in center and is a very strong grower. It is a seedling from Sachem. No. 169 is another robust grower with immense cream white flowers of great size and substance, its only drawback being that it shows the yellow center when fully expanded. Mrs. E. D. Adams is one of the best. It is also creamy white and forms a grand specimen bloom, the outer petals having a very pronounced twist. A single bloom of this variety extended out flat measured 18 inches from tip to tip of petals. Geo. Savage is an incurved white, a perfect globe and very symmetrical. Mrs. Dr. Mandeville is a fine incurved, color orange brown, an immense flower. Miss M. Colegate is a superb incurved white, first class in every respect, stems very stout and furnished to the top with foliage. Other varieties worthy of mention were A. G. Ramsay, red reflexed; Miss Bertha M. Robinson, pink incurved; Miss Mercer, pink shading to yellow center; 309, silvery pink incurved, a good market color; Mrs. W. S. Kimball, creamy white shading to yellow center; Mrs. Hood Wright, purest white, very early; Dr. Mandeville, grand yellow; Ulysses, a striking red reflexed; No. 5, a Japan importation, of Molineaux type, but darker and richer in color, petals very broad; and Gen. de Negrier (French), brilliant scarlet, a grand color.

A specimen plant of Daisy, a single white variety, attracted much attention from its beautiful symmetrical form and wealth of bloom. It was really one of the finest plants in the show.

The cypripedium display, as would be expected, was a great feature. There are two houses filled exclusively with cypripediums, of which 185 varieties are in bloom, some of them being specimen plants. Of C. Spicerianum there are some very large plants in full bloom. Of C. insigne there is an almost endless variety of new forms, one of the rarest being C. Amesianum, which is wholly destitute of

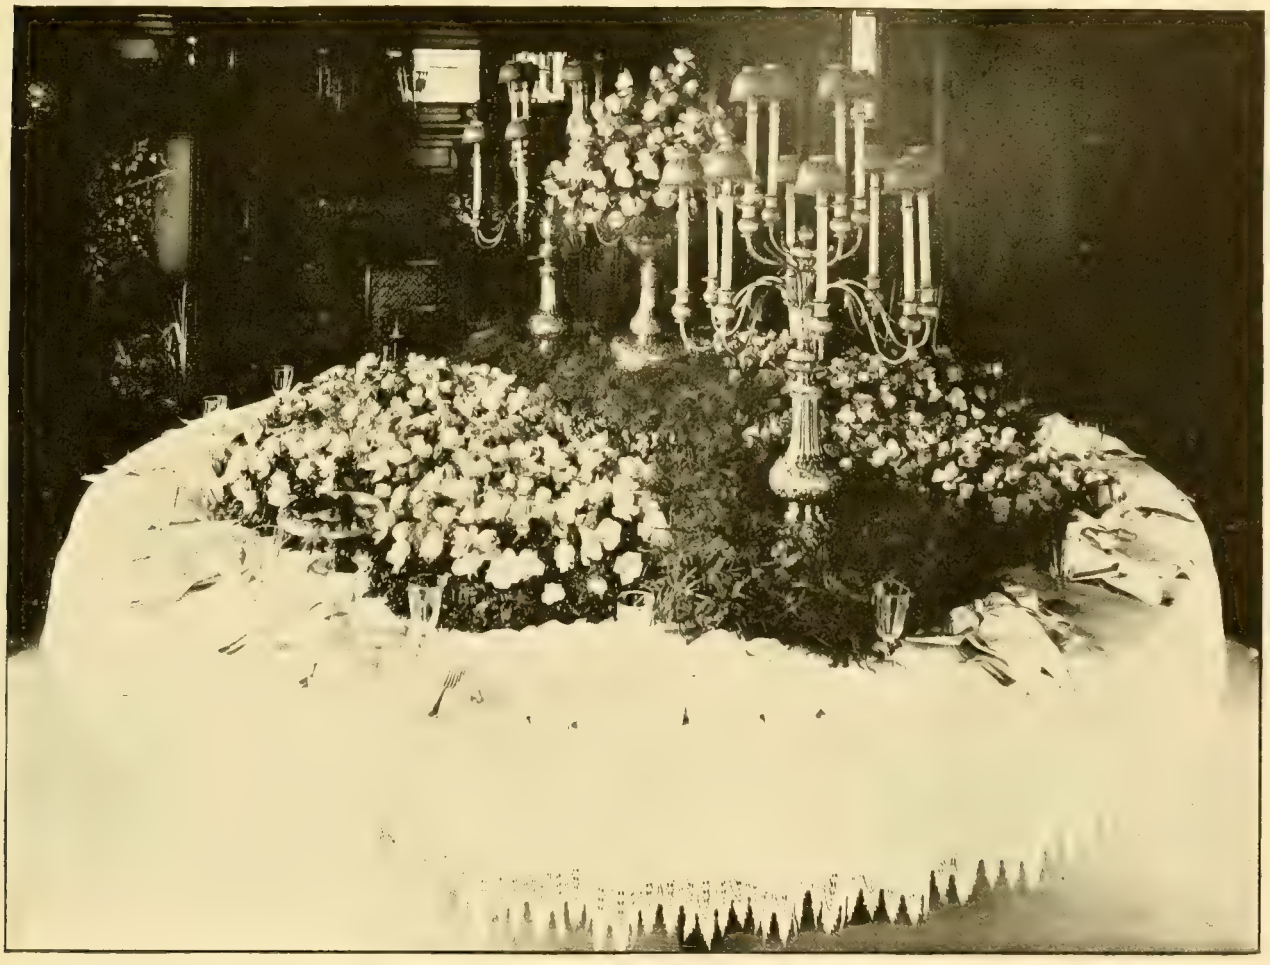


TABLE DECORATION. SEE PAGE 276.

spots. Among the very rare ones in flower were Pavonianum inversum, Shroderæ splendens, microchilum, Crossianum pallidum, marmorophyllum superbum and magniflorum. One house of blooming orchids in variety was exceedingly brilliant, being grouped with an immense number of lælias, cattleyas, lycastes, odontoglossums, oncidiums, etc. Vanda Sanderiana was shown in several varieties, one very brilliant, one bearing four large spikes of bloom. Another interesting plant was Cattleya labiata, Pescatore's variety, Cattleya Wallisii, the white variety of C. Eldorado. A unique, chocolate colored Lycaste Skinnerii and Lælia elegans prasiata were also among the rarities. A house containing 10,000 plants of Cattleya Trianæ recently received from one collector gives an idea of future glory, although not specially attractive to the average visitor as yet.

After going through the tropical houses, the forests of palms and towering tree ferns one begins to get some idea of the magnitude of this establishment which has sprung up within such a short time and already employs a regular force of 175 men. It is estimated that fully 10,000 persons have visited this great display within the past week.

A Flower Market.

A great deal has been said as to different ways and means of disposing of flowers to the best advantage to all in the trade.

I especially refer to New York City, as I am better acquainted with this market than any other. The grower, commission man and retail dealer for some time past have been dissatisfied with the way business has been conducted, which will probably be the case no matter how business is done. I have an idea as to doing business which I think will be a benefit to everyone in the trade, without making a monopoly or altering the ways of doing business at the present time.

My idea is to have one general market to be rented by the Florists' Club or any body of incorporated florists. A building large enough to accommodate all the commission dealers and growers wishing space to dispose of their flowers. Let this building be in a central location to the retail flower trade. I believe in this way of doing business. The commission would be less, also the expense of the wholesale dealer, and a great benefit to the retail dealer, he having the benefit of seeing all the flowers that arrive in the market, whereas at the present time if one retail buyer happens to do business with any one or two wholesale dealers he does not know what many others have. The grower also would have the benefit of seeing all the product shipped to the market without visiting every wholesale dealer's place of business in different parts of the city. I do not think the wholesale dealer would have any more trouble with the grower, saying he saw Mermets or any other variety of flowers at another wholesale dealer's place, not so good as his, sold for 2 cents more, as in a market of this kind every man can see for himself.

I do not think that any scheme or arrangement could be made a success without having the combination of all in the trade. A market controlled by the growers would be a failure without a doubt, as it would be like one wholesale dealer handling a few growers' product. I do not think it would be possible to get every grower to combine in the scheme, and we would surely have wholesale dealers as before.

Another scheme has been spoken of in the way of disposing of flowers by auction. As I understand it the idea would be to arrange the different varieties in vases, 25 or 50 flowers in each, and dispose of them to the highest bidder. I think this would be very satisfactory to the retail dealer and very unsatisfactory to the grower, as I believe he would be very liable to receive a great deal less for his flowers than he does at the present time. It would work very well if flowers were as scarce as they were ten years ago, when anything in the shape of a flower would sell, but at the present time there are enough flowers to supply the demand, in which case the retail buyer would make the price. Would this be satisfactory, grower? I should like to hear from others on this subject, especially the growers, as they are the ones most dissatisfied with the way business is conducted at the present time. H. E. BLAUVELT.

Seasonable Notes.

Now that the battle is upon us, it is to be hoped that victories will be numerous.

In awarding certificates to seedlings, let it be borne in mind that none should have certificates unless they are actually superior to the existing kinds; certificates should mean the sterling mark. I mean not to prevent the competition where prizes are offered for seedlings; on the contrary, let them be encouraged. And if there are among these competitive seedlings any that are superior, let the society award a certificate, which should be worth more than any individual award.

Here are some points that seedlings should possess if certificates are given:

Characteristic form, pleasing color, long and strong footstalks, thick leaves, and compact habit.

Flowers must wear well after being cut.

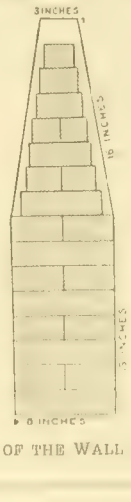
To be shown with stems not less than a foot long.

They must be better than any of the same type or color. JOHN THORPE.

New Jersey Social Florists' Club.

At the meeting of the club on October 22 Mr. J. R. Johnson of Short Hills read an interesting paper on chrysanthemums.

In the course of a brief resume of the history of the plant he said that to English growers a major portion of the credit for the development and improvement of the chrysanthemum is due, great attention having been paid to it there during the whole of the present century, and noted the fact that every town of any importance in England has its chrysanthemum society. He referred to the growing importance and popularity of the flower here as shown by the estimates which place the number of exhibitions in this country the present year at 75 per cent in excess of the number last year. He mentioned Fortune, Salter, Molineaux, Laing, Cannell, Glenny and others in England, and Thorpe, Hill, Harris, Pitcher & Manda and Spaulding in America to whose energy, zeal and love for the flower much of its success is attributable.



Passing on to a consideration of the cultivation of the chrysanthemum he emphasized the importance of a systematic and intelligent course of treatment, with strict attention to detail, if exhibition plants or specimen blooms are wanted. He recommended as the best soil for their successful cultivation good turfy loam about four-fifths and leaf mould and sand one-fifth, with a liberal sprinkling of bones. This compost, together with clean pots, well drained, he said would be found a potent factor towards success.

For specimen plants he recommended taking cuttings in beginning of January. Great care should be exercised that the plants do not receive a shock from becoming pot-bound and also that they receive plenty of water, for while the chrysanthemum responds readily to good treatment it likewise is very sensitive to any shock. It is well to bear in mind that every time the plants become dry or pot-bound it lessens materially the grower's chances of success. He recommended the first topping of the plants when they are six inches high and that all pinching should cease by middle or end of July. For flowers and specimen blooms he mentioned March or April as the best time for propagation and advocated planting out in a house where sash can be removed altogether and replaced as required. After a few remarks regarding the classification of the chrysanthemum he passed in conclusion to a consideration of the possibilities of the flower in the future, asserting that there is still room for great improvement and plenty of opportunity for profit in the production of new varieties. He argued in support of the theory that a blue variety is possible and is well worth trying for. The man who shall be fortunate enough to introduce it to the world will establish himself as a celebrity in the annals of floriculture and "there's millions in it."

Growing Pond Lilies.

Mr. John McElvery is a boss carpenter living at Flatbush, L. I., and a most enthusiastic amateur florist. His taste leans to bulbous plants and aquatics. He grows plants and flowers because he loves them, and not from any mercenary motive, for he does not sell any product of his garden. The Flatbush horse cars from Brooklyn run past his door, and it will profit any florist to visit him.

About the middle of last August I called to see Mr. McElvery's lily pond, and it was grand! Although I have seen many lily ponds in many pretentious gardens, I never before saw anything to equal the happy luxuriance and floral profusion presented in this little Flatbush tank.

SECTION OF THE WALL OF POND

But how does this profit the commercial florist? A case in point: When I got there I found there too a lady and gentleman from Brooklyn. They had been dabbling in aquatics for a year or two, and with but very indifferent success; indeed, some expensive plants they bought from a florist who makes a specialty of aquatics last spring didn't grow at all. Of course, they blamed the florist and wrote to him to tell him so. He replied: "Go to see J. McElvery's aquatics at Flatbush; he bought his plants from me and they have done well." They did go, and I found them there, and a more delighted party I hadn't met for many a day. The "rascality" of the florist had vanished from their imagination, they themselves were at fault, their treatment of the plants was wrong, and they noted the varieties that pleased them most and which they hadn't got, and went away to salve the "fraudulent" florist with a new order.

At my request Mr. McElvery has written the following article, giving unreservedly the details of his practice, and had the accompanying pictures taken especially for the FLORIST.

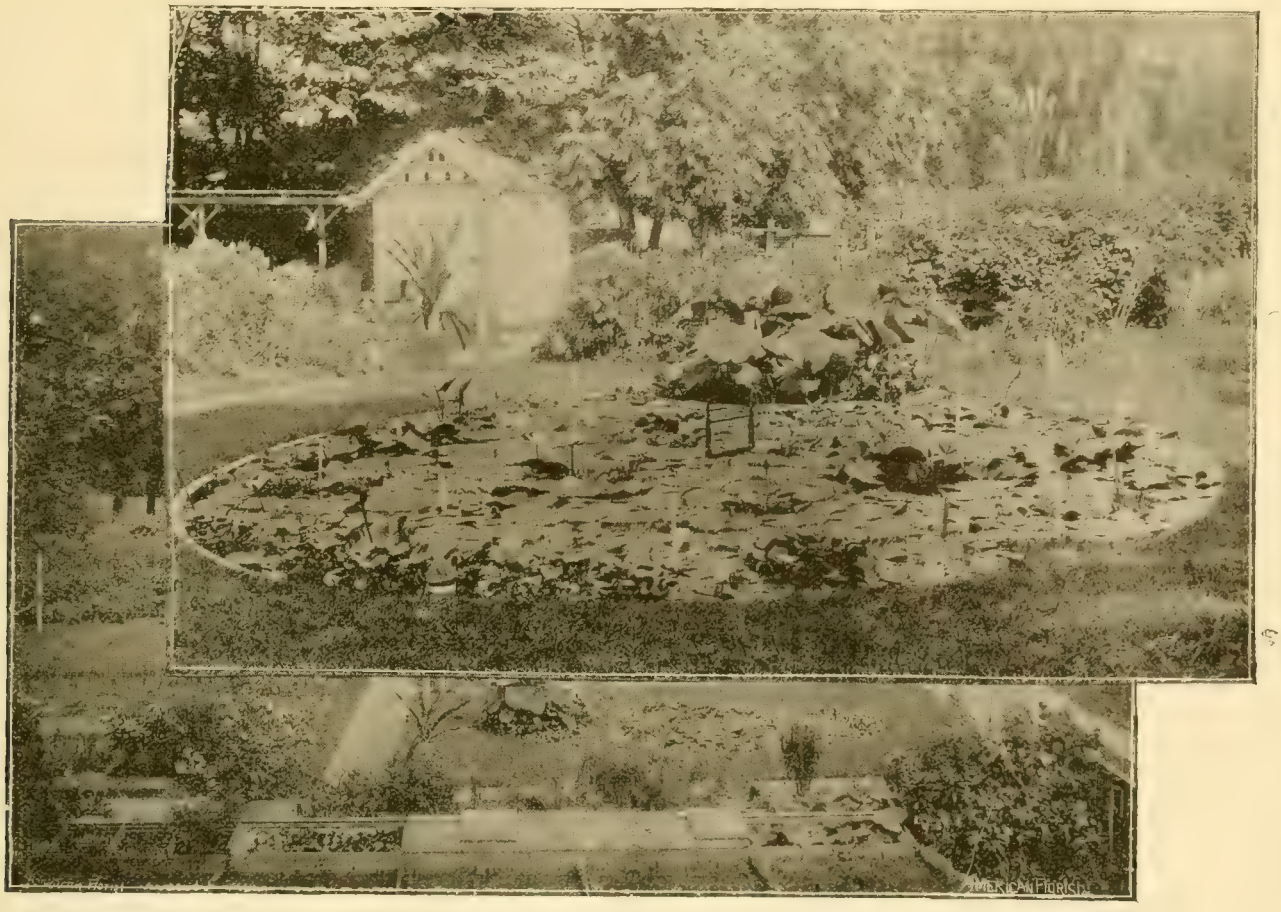
WM. FALCONER.

How I Grow Aquatics.

BY JOHN M'ELVERY.

My little lily pond is on a level grass plat at the end of our dwelling house. It is of oval form, 25 feet long, 19 feet wide, and 32 inches deep. The bottom is concreted and cemented, and the side walls of brick laid in cement and lined both back and front with Portland cement. The walls from the base for 16 inches up are 8 inches thick, but from there to the top they taper, both sides alike, to 3 inches wide.

This tapering at the top not only gives the tank a neat appearance, but is serviceable in lessening the pressure against the wall from frost in winter, both from the water in the pond and the ground on the outside.



Provision is made for draining the water at will from the bottom of the pond, and also the overflow pipe being made of rings or sections like a pocket drinking cup, I can have the water at any height or shallowness in the pond I please.

Before commencing to concrete the bottom of the pond I put in the center a cedar post 4 inches in diameter and rising 6 inches above the water surface; around the top of the post is an iron band to strengthen and prevent it splitting, and downward from the top I bored a hole, and inserted in it a 1-inch piece of gas pipe, and on this pipe is secured a revolving double T, which can be seen in the middle of the pond. The use of this double T is to support the end of a plank, the other end of which rests on the grass outside the wall. This plank is used as a pathway into the pond, and I find it indispensable in planting, cleaning off dead leaves, gathering flowers, regulating the distribution of the plants and foliage and getting seed; and by lifting the end that rests on the grass, I can carry it around the pond wherever I please, the other end resting on the revolving T, moving around also, and in this way get to any part of the pond I wish with very little trouble and without getting wet.

The water I use is the rain water from my dwelling, and which is led into the pond from an iron pipe connected with the leaders, and passing underground to the tank. This gives me soft water at an even temperature with the atmosphere. The water in the pond is not heated artificially in summer, but can be in spring or fall.

The soil used consisted of fresh loam and cow manure in equal parts, and 75 pounds of bone flour, all mixed well together and put in 16 inches deep.

I planted out the hardy lilies during the last week of April. These consisted of 3 plants of Nymphæa odorata, 3 N. odorata var. rosea, 1 N. pygmæa, 2 N. candidissima, 1 N. flava, 1 N. Mexicana, and 1 N. marliacea chromatella, a plant of the deliciously fragrant Cape pond weed, Aponogeton distachyon, and a plant of Nelumbium speciosum. As the nelumbium is a tall and vigorous grower, and spreads considerably at the roots, you will observe in the picture that it was planted at the end of the tank, and in order to be able to keep its roots within bounds a 4-inch brick wall has been built up around the clump. On the 1st of June

THE UPPER PICTURE GIVES A VIEW OF MR. McELVERY'S LILY POND, AND THE LOWER ONE HIS TANK FOR PROPAGATING, AND WINTERING TENDER SORTS.

I added 1 N. dentata, 1 N. Devoniensis, and several blue, purple, and rose-colored forms of N. Zanzibarensis. All of these, both hardy and tender, have grown well and blossomed beautifully, and the aponogeton and N. pygmæa and N. Zanzibarensis have been in bloom continuously. Have had as many as six flowers open on N. dentata at one time, and they averaged 8 inches across; indeed, one of them measured 10 inches. And on the 25th of August, on one plant of N. Devoniensis, were 16 open blossoms and 18 unopen flower buds.

In addition to the foregoing plants there are in the pond Nymphæas scutifolia, cœrulea and rubra, also the little floating moss (Azolla Caroliniana), water lettuce, (Pistia stratiotes), water poppy (Limnocharis Humboldtii), water hyacinth (eichhornia), and callas.

To act as police in the matter of grubs and mosquitos and other insect vermin, I have a number of silver-fish, gold-fish and spotted sun-fish in the pond, and also one or two frogs and a turtle. And to please the children a decoy duck, row-boat, sail-boat and schooner, all in miniature, find a place upon the water.

Near by the pond I have a tank 6 feet wide, 30 feet long, and 32 inches deep, made of brick and cement and divided into four equal parts. It is gotten up in hot-bed-like fashion, roofed with movable sashes, and heated by hot water pipes from a small boiler set in a pit alongside of the tank. And the heating arrangement is such that any one compartment can be heated independent of the others, or more than one or all can be warmed at pleasure; further, by means of a flow and return 1¼-inch pipe passing from the tank into the pond the water in the pond can be heated at will, if so desired. Indeed, I believe to this is due a good deal the kindly start my plants take in early summer, and their extra lateness in keeping in bloom in fall.

I built this tank with the view of wintering my tender lilies in it and propagating and giving the plants a good start before planting-out time. In the summer time it is uncovered and a perfect glory of pond lilies of all kinds, sizes and colors, for it as well as the pond is filled with flowering plants.

In one section of this tank, February 1 last, I sowed seed of three varieties of N. Zanzibarensis, and on May 1 two plants raised from these plants were in bloom. The seeds were sown in a large flat box immersed in the water, and when the seedlings had 3 or 4 leaves apiece, I transplanted them singly into boxes 6 inches square by 4 inches deep, and made of ½-inch rough pine, using soil same as for outside pond, and put the boxes into the tank one inch under water. Kept the temperature of water at 70° or 80° (and once by accident it got up to 110°, but without any visible injury to the plants), and as the plants increased in size lowered the boxes a little more till they rested in a 16-inch deep bed of loam in the bottom of the tank. During the summer I have had as many as 8 or 10 blooms open on one of these plants at a time. I also planted out some of these lilies in the pond where the water was 15 inches deep; others in butter tubs and set out in the pond with only three inches deep of water over them. But the best results both in size and quantity of blooms, were obtained from the plants growing in the 6x6 boxes in shallow water, the next from the butter tubs, and the poorest from the plants set out in the bed in the deep water in the open pond. But the boxes containing the plants giving the most satisfactory results rested on a bed of loam, into which the roots found their way through the apertures in the bottom of the boxes.

The roots of the tender kinds, with a few pieces of the floating plants I lift in fall, and put into the tank in the pit. The hardy varieties will be left outside in the pond, which will be covered over near the margins with boards, tree leaves, and other handy material to keep the water from freezing deep.

Let me advise amateurs not to plant too thick, for it is the leaves growing so thickly together and overlapping each other that causes so many of them to get broken, disfigured, and withered through the summer.

Water lilies seed generously, and the seeds germinate freely, often giving blooming plants when the seedlings are 4 months old. To catch seed that has escaped from a burst pod in the water, and is swimming about on the surface, I have had made by a tinner a small pan of finely perforated tin in the form of a dust-pan and open at the top, and for washing the pulpy substance from the seeds in have had a second pan made just like the other, but closed on top so as not to let the seed escape in washing. In saving seed, as soon as it is washed I put it into a tumbler filled with water and let it stay there till the coating rots off and the pure seeds fall to the bottom of the glass.

New York.

Chrysanthemums and the chrysanthemum show form the all absorbing topic at present in floricultural circles and there is no interest left for anything else. Roses have to take a back seat for the time being. The recent bright weather has also increased the cut of roses and the result is a market overstocked and a decline in prices. While the figures quoted on small lots or extra selected stock do not show much of a drop from last week, yet when it comes to the transactions in which large quantities are disposed at once the prices received have been very low, say $15 to $20 per 1,000 for good assortment of roses.

American Beauty still holds the supremacy and is really the only high grade rose in the market. First quality blooms sell as high as $30 per 100. Mme. Pierre Guillot is improving in quality and is beginning to be looked upon with favor. A large vase of Cornelia Cook roses on Thos. Young's counter recently was quite a curiosity and was a sort of reminder of old times. They came from that old time grower, Littlejohn.

Carnations continue to sell well. Violets are not in good shape yet, although improving. The supply is far short of the demand: the same is true of lily of the valley, which has advanced to $8 per 100.

Chrysanthemums, if extra fine blooms, sell well considering the quantity offered. A great many of the best are being reserved by the growers for exhibition purposes and this helps to keep the price of specimen blooms quite steady. In the cheaper quality white flowers seem to sell most readily.

Mr. Thos. E. Keegan, formerly bookkeeper for Thos. Young, Jr., died on October 29. He has lately been in the employ of Mathieson on Sixth avenue. He was one of the best liked men in the business here. Many beautiful floral tributes were sent to the funeral, including an ivy cross from the clerks and a handsome wreath of pansies from John Young.

Louis Patterson, for several years foreman for Thos. Young, Jr., is no longer in Mr. Young's employ.

At the October 27 sale at the auction rooms of Wm. Elliott & Sons, Marie Louise violet plants brought from 17 cents to 20 cents, Swanley White went for 8 cents. Carnations Hinze's white, Emily Pierson and Lamborn brought 4½ cents, 6 cents and 8 cents respectively.

Mixed hyacinth bulbs sold for $2, mixed tulips for 50 cents, narcissus $1, crocuses 25 cents and Lilium Harrisii for $4 per 100.

There was a choice assortment of stove and greenhouse plants from John S. Bush. A set of six Nepenthes, viz., Hookerii, Mastersiana, Chelsonii, Veitchii, Rafflesiana and Dicksoniana, brought $1.50, $2, $1.25, $3, $2.25 and $1.25 respectively. Nice plants of Adiantum Farleyense sold for 75 cents. Cycas circinalis, six feet high, brought $19.

The stock at R. B. Young & Co.'s consisted principally of palms and foliage plants. Araucaria excelsa from 3 to 4 feet high brought from $2.50 to $7; A. excelsa glauca, same size, brought $5 to $6.

There was a good number of fine plants of Cycas revoluta sold. Plants with 15 to 20 leaves sold from $4 to $5. Specimens bearing from 35 to 50 good leaves brought from $26 to $48.

The scheme for selling cut flowers by auction seems to have died in extreme infancy. It must have been a very weakly child.

Ernst Asmus is cherishing an improved Mme. Cusin, which he says is a stronger and better rose every way than the original variety. Possibly it was at a time when his mind was engrossed with visions of future profits from this acquisition that he inadvertently exchanged overcoats with a strange man, as is rumored.

There is considerable criticism hereabouts regarding certain circumstances connected with the settlement of the Jas. Vick business. Details later.

Your Philadelphia correspondent appears to be getting very particular. The Philadelphia boys first made the proposition for the bowling match and it was at the time considered by the New Yorkers present as a challenge. It makes little difference who made the challenge, however. Who will win the trophy? That's the question.

ON THE JERSEY SIDE.

Ernst Asmus' big establishment at West Hoboken has been a shrine for chrysanthemum lovers during the past two weeks. Such a display in quantity and quality is rarely seen, and if Mr. Asmus don't capture a goodly share of the big premiums offered at the various exhibitions it won't be his fault. With the exception of one housefull, which are grown to single stems, all his plants are grown with from three to five blooms. The number of varieties is very large, including a great many new kinds, as well as the best of the old varieties. Gloriosum is done so well here that the flowers would scarcely be recognized as belonging to that variety. Jessica and Domination are also very fine, the latter, however, having much more of a pink tinge in it than is usually the case, and not so pleasing to look upon as when pure white. Ada Spaulding and Molineaux are both grand. Rohallion has proved itself here as elsewhere to be a first-class early. Mary Wheeler is an unusually high-centered pink variety, and Mary White Thomas, a late one, waxy white, promises enormous blooms. Mr. Asmus is particularly struck with the good qualities of Mermaid, Fred Dorner's pink seedling.

One of the most satisfactory varieties is Ivory. A long bench of it in full bloom is one of the prettiest sights in the whole establishment. The plants are very dwarf, of uniform height, and the blooms of purest white and unexcelled in form.

Two seedlings, Vesuvius and C. B. Whitnall, both incurved, promise well. The color on the inside of the petals in both these varieties is of an unusually rich velvety red.

Among the new French varieties, Mr. Asmus mentions Sabina Mea, a yellow globe-formed early flower, not large, but of good form and very pretty. Fred Bergman, white, no good; and Rose Laing, color similar to a La France rose after a three days' sojourn in an ice-box.

The Meteor rose is blooming finely with Mr. Asmus this season. He attributes the bull-heads and general failures of other growers with this variety to too low a temperature. He claims that it needs plenty of heat to be grown successfully.

Julius Roehrs, at Carlton Hill, has also made considerable preparations to compete for premiums, this being his first year of growing chrysanthemums for exhibition purposes. H. E. Widener and Miss Wanamaker are magnificent here. He has been going heavily into new varieties, some of which promise well, while many prove unworthy of cultivation and of no credit to their introducers, whose short-sightedness in sending them out Mr. Roehrs denounces in very vigorous language. Among the new ones that appear meritorious are Mon Ami Hughes, a fine early white incurved; Mrs. Frances Schener, a dwarf early yellow; James R. Pitcher, which is similar to Mermaid and possibly a little better in color than that variety; and Carrie, which promises to be a fine large white.

Mr. Roehrs' stock of palms and decorative plants is as big as ever, apparently no end of houses filled to overflowing with kentias, latanias, arecas, etc., in every size. One house of araucarias is well worth going many miles to see. There are very few of the common excelsa to be seen, but a host of beautiful specimens of such splendid varieties as excelsa glauca and robusta. The center of attraction is two fine plants of glauca robusta, said to be the only two in this country.

A housefull of Pandanus Veitchii is also worthy of a visit. The plants are unusually well colored.

Two specimens of Draceæna lineata are deserving of notice from the fact that they were planted out of doors last spring while quite small plants and are now splendid specimens five feet high, furnished from the pot up, without a blemish.

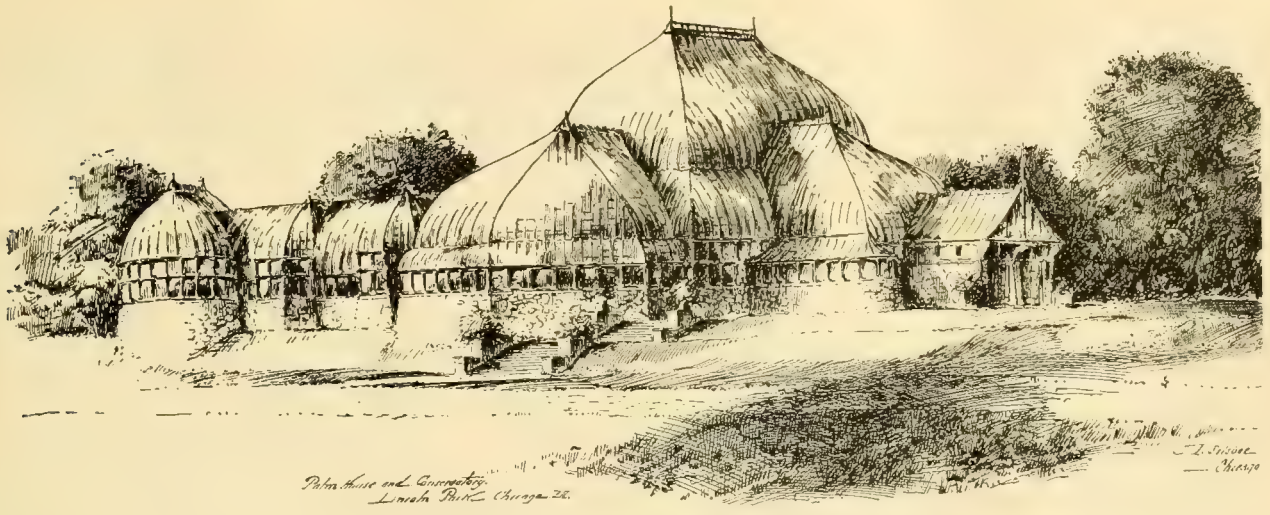
Mr. Roehrs evidently was not satisfied with his hybrid rose business last winter, for he has turned several of his hybrid houses into azalea houses, and has filled with a very fine collection of imported azaleas in pots in all sizes.

Philadelphia.

The past week has been the busiest of the season. There have been a number of fashionable weddings with more or less floral decorations, some of them being quite elaborate. Choice flowers of chrysanthemums were largely used.

Some very fine Ivory and Mrs. Bullock are now being sent in by Messrs. Harris, Scott and Heacock. Ivory is without doubt the finest white in cultivation.

Robert Craig has a house of Widener which looks very fine; he will commence to cut this week. His lot of seedlings are developing magnificent flowers and we fully expect to see some new varieties of merit added to the already long list. He received the past week a large consignment of Bay laurels and araucarias from Europe; they arrived in fine condition and are a splendid looking lot of plants.



Edwin Lonsdale has been indisposed and confined to the house for a few days past with a severe cold. We are happy to say that he is on the mend and will be about again in a day or two.

Everything about his place seems in apple pie order; the stock, especially the roses, looks very well. He thinks the new rose Mme. Pierre Guillot will be a good one and a great improvement on Mme. de Watteville, which it resembles in color.

His stock of orchids is in fine condition and should produce abundantly this winter. He has a fine stock of Areca lutescens.

At John Burton's we noticed the roses were tied to galvanized iron rods of No. 14 wire. These are tied at the top to wires running the length of the house. This plan seems to have advantages over all others, as there is nothing to wear out, and when the soil is being changed the rods can be taken down and laid away and are ready for use at any time.

A house of cypripediums is a mass of buds and flowers, in fact everything about

NEW CONSERVATORIES AT LINCOLN PARK, CHICAGO.

the place seems in a perfect state of cultivation.

Mr. Farson, secretary of the Penna. Horticultural Society, says that the entries for the coming show are so large that it will be difficult to obtain room to provide for all the exhibits. All he wants now is good weather and the show can't help but be a grand success from every point of view, the box office included.

The improvements in the library are about completed and the room will soon present a very inviting appearance.

Henry Rainey died October 28, aged 68 years. Mr. Rainey's first position was with Henry Dryburg, of camellia fame, where he finally rose to the position of foreman. After a long service he resigned to take charge of John Dick's city store, which he carried on successfully for a number of years. About 1865 he left Mr. Dick and started in business for himself, which will now be continued by his son Henry, who was recently admitted to the firm. Mr. Rainey was very well liked by the trade and loved to talk of the good old times when camellias brought $1 a piece and roses were not even thought of.

Valley is scarce and commands $8 per 100. Roses are fairly plenty, the best Brides, La France, Mermets, and Cusins bringing $4 to $5; $3 is asked for Perles, Niphetos and Gontiers. Fair Beauties are to be had for $20. Choice chrysanthemums sell for $15 to $20, and the commoner flowers from 10 cents a spray to 50 cents per 100.

The Stylus Club, of Philadelphia, gave a dinner last week, the decorations for which were quite novel. It was called a Sylvan dinner and the entire dining-room was transformed into a veritable forest.

Doors, windows, walls and floor had all disappeared from view, and the spectator on entering from a side room through a leafy bower beheld nothing but trees, bushes, vines, and flowers in the dim lights that swung from the branches of the pines, firs, and maples. The floor, or rather the ground, was covered with thousands of autumn leaves in all their beautiful variegated colors, little fields of daisies here and there dotted the earth, and pumpkins and other products of the soil were scattered about as on the outskirts of the wood. Little nooks under canopies of foliage were filled with rustic chairs and settees.

The table was spread under the overhanging branches of the trees, and was decorated in exquisite taste. When the members and guests entered the woods in the dim light and arranged themselves around the table, soft music from an invisible orchestra floated through the trees. As they took their places around the table the forest was suddenly illuminated by a blaze of myriads of colored electric lights. Overhanging the head of the table a beautiful shield, with the figures "14" in electric jets, was lit amidst the singing of birds which flew about the branches, and the chattering and grimacing of monkeys clambering on the trees.

Mr. Rob't Craig is very enthusiastic over the fine qualities of the new early chrysanthemum, "Mrs. J. G. Whilldin." It is a fine yellow with full, high center, almost a globe when fully blown and is likely to displace Gloriosum as an early yellow, being of much better form and substance than that variety.

New Conservatories at Lincoln Park.

We present herewith an engraving from the architect's drawing of the new conservatories now in course of construction at Lincoln Park, Chicago. The height will be 54 feet at the center and 30 feet at the ends, and that of the orchid and New Holland divisions, 20 feet. The building will stand seven feet above the lawn and the ground will be terraced down to the flower garden in front.

Hot water will be the system used in heating and to overcome friction in the long length of pipe used a steam pump will be connected with the return pipe near the boiler and thus the water will be impelled into a more rapid circulation, which can be increased or retarded at will by increasing or diminishing the speed of the pumps. The pressure system will be adopted whereby the temperature of the water can be increased to 250° if required. The radiating surfaces in the houses will be cut into independent sections, each controlled by automatic heat regulating devices.

The houses are constructed entirely of stone, iron and glass; trusses, rafters and purlins of wrought iron. The bars are of the Hellewell patent (steel and zinc) and the glass rough ribbed plate.

The construction of a fernery alongside of the conservatory, 90x60 and 25 feet high, is deferred until another season. The house will be of stone walls and glass roof and will be lower than the palm house by 6 feet and will have masses of rock filled in a picturesque fashion along its walls, and with running water, cascades and ferns planted among the rocks will simulate the fern tufted rocky dells of nature.

Boston.

The stock of chrysanthemums coming to the city every morning at present is very fine. The average run of the great bulk of the blooms seen in the florists' windows equals what two or three years ago was prize-winning stock, while the extra fancy blooms are such as were scarcely dreamed of a few years ago. Very few of the old-fashioned common stock in bunches is now sent in. What little there is goes for 50 cents a bunch, but even the street fakirs turn up their noses at it. Good average blooms bring from $1 to $2 per dozen, and some extra fine stock sells as high as $4 a dozen.

Carnations still hold up well, both in quality and price. Some of the Grace Wilder's coming to this market now would scarcely bear out Mr. Dorner's theory of the short life of an individual variety as expounded by him at Toronto last August. Since Wilders were first grown they were never finer than they are this year. Roses are weakening somewhat under the influence of the chrysanthemum and the pleasant weather.

Referring to the current criticisms on the behavior of the Waban rose, Mr. W. H. Elliott says that his faith in it is not shaken in the least. He planted 1,000 of that variety and has been watching them carefully. His experience so far leads him to think that the Waban will throw under equal conditions nearly if not quite 50 per cent. more blooms than the Mermet, so that even if sold at the same price per bud as the Mermet the net proceeds would go a long way towards offsetting the extra cost of the plants at the beginning. He finds that the Waban throws smaller and weaker growths than the Mermet and the tendency is to somewhat smaller blooms; also that when it does flower on large, vigorous growth the buds are apt to be malformed. In color it is fully up to expectations.

Mr. Wm. Edgar is cutting quantities of fine chrysanthemums and will have some

good blooms for the exhibitions. His crop of Mme. Le Croix is almost entirely cut. Cannell he likes better than Kioto, on account of the growth of the foliage closer up to the flower. Of this variety he has splendid specimens, also of those two magnificent white varieties, Bride and Mrs. Langtry. Domination is also looking unusually fine. He has a sport from Domination which is much admired. Its color is a very clear pink. Mme. Louise Langlois, he says, is no good. It is a thin flower, and the petals drop off badly in handling. His three houses of Grace Wilder carnations are in promising condition; also a house of mignonette which will be ready to cut in December.

Mr. H. A. Gane is an amateur, a great chrysanthemum lover. At his conservatory in West Newton he has a number of beautiful seedlings, one of which, a pearl white seedling from President Hyde, looks very promising, and another one, also white, has most remarkable foliage, it being thick and almost as glossy as a holly. Mr. Gane has the best plant of Louis Boehmer ever seen here. It bears twelve splendid specimen blooms. Mrs. J. N. Gerard is also in extra good shape.

Mr. A. H. Fewkes has a good display of specimen flowers, including Mrs. J. N. Gerard, Vivian Morel (Fr.), Mme. Eugene Mulson (Fr.), Mrs. W. Baker, one of the Mrs. Hardy set, Duchess of Connaught and Coronet.

From the Waban conservatories there are coming into the market every day some superb specimen chrysanthemum blooms. Their quality is best described by saying that the price they bring is nearly double the average received by other growers.

Mr. Elijah A. Wood is greatly pleased with this year's experience with two of his last season's seedlings, Mrs. E. W. Wood and James H. Freeland. A seedling of this year which he has named Edward Hatch shows up finely. It is a very full, high flower, color similar to Puritan, white, with violet pink shading. Among his specimen blooms for exhibition is one flower of Ernst Asmus, which looms up with a luster equaled only by its great namesake.

The following scale of points will be used in judging plants at the chrysanthemum show of the Mass. Hort. Society.

No. 604 to be judged by the following scale of points:

	Points
Size and form of plant	25
Size of bloom	20
General effect	30
Foliage	25

Nos. 601 to 613, inclusive, to be judged by the following scale of points:

	Points
Size and form of plant	40
Size of bloom	30
Foliage	30

In addition to the regular prizes the G. & F. club offers a liberal prize for ten vases of long-stemmed flowers in ten varieties. Peter Henderson & Co. offer a special premium for the best 12 blooms of Louis Boehmer.

The annual supper of the G. & F. club will take place on Wednesday evening, November 11, to be preceded by the bowling match in the afternoon. Quite a number of notable visitors are expected.

Mr. John Walker, representing Robert Craig, of Philadelphia, has been perambulating Boston for the past week seeking orders for palms and other decorative plants. If he succeeds as well as the house deserves he will go back with a full book.

ALWAYS mention the AMERICAN FLORIST when writing to advertisers.

Chicago.

Preparations are now complete for the exhibition of the Horticultural Society next week. The preliminary announcements have evoked much inquiry and the public seems greatly interested. Barring unfavorable weather the exhibition will be so far ahead of previous efforts in this direction as to make comparison decidedly odious.

Chief Thorpe, of the Floricultural Division of the World's Fair, is again confined to the house by his old enemy, rheumatism, and as a result he was unable to go to New York to see the great exhibition there, as he had anticipated. Mr. Thorpe's family has arrived from the east, and "Uncle John" is getting settled for his long stay in this city.

On the 28th ult. Mr. Thorpe received a lot of handsome chrysanthemum blooms from H. L. Sunderbruch, of Cincinnati. The lot included Domination, Alcyon, H. E. Widener, Ada Spaulding, Louis Boehmer, Mrs. Irving Clark and others, and the flowers averaged 8 inches across.

Florist, fruiterer, caterer and intelligence office is the latest combination. It has materialized on the North Side.

Geo. A. Solly & Co. have opened a floral store at 83 Forty-third street and will also do landscape gardening.

At Ravenswood C. Naslund has added six new houses each 18x120. The entire plant will be devoted to growing cut flowers for the Chicago market.

Messrs. J. T. Anthony and O. P. Bassett left for New York last week to attend the exhibition there. They will return in time for the Chicago show.

Mr. J. C. Vaughan's greenhouses at Western Springs are now gay with thousands of chrysanthemums, and the large number of new sorts in bloom makes the display of very great interest. A few of the sorts that attract special attention just now are Waban, a very large, striking flower of a beautiful shade of pink; Beatrice Card, in the way of Cullingfordii as to color, but even richer; Clara James is decidedly unique, and J. C. Vaughan is in the way of John Thorpe, but with broader petals and richer color, the outer petals recurved and the inner ones incurved. There are some splendid specimen plants, including some noble standards, here, and they will undoubtedly be a most attractive feature of the coming exhibition.

Among other plant novelties to be seen here and that give special promise of being useful, are Fuchsia Beauty of Exeter, which seems to possess the varied requirements of a florist's market plant to a marked degree, and a new tropæolum (not yet named), with markings as soft and beautiful as those of a pansy. The new rose, Triumph d'Pernet, is considered an unusually promising forcing variety. It is a hybrid tea, has the form of the Jack, is very finely colored, a good grower and free bloomer. Among the recent importations is a lot of imantophyllums, for which there is thought to be quite a future, and a variegated grass with the delightful name of Ophiopogon Jaburan aurea var.

St. Louis, Mo.

The premium list for the first annual chrysanthemum show and floral exhibition of the St. Louis Florists' Club has been issued. The premiums are very liberal, the club having been enabled to cover a large field without stinting in any classes through the liberal assistance from the Henry Shaw estate. The premiums for orchids and seedling chrysanthemum plant are both offered by the Shaw estate. Though this is the first effort of the St. Louis Florists' Club, it is supported by the enthusiasm of all members of the club and the public is displaying much interest. It is hoped that growers in other cities will compete. Premium lists may be had on application to the secretary of the club, Mr. Emile Shray, 4101 Pennsylvania avenue.

The second annual banquet to florists, nurserymen and gardeners, instituted by Henry Shaw, will be given at the Mercantile Club Tuesday evening, Nov. 10. This is always a very enjoyable event and is looked forward to with pleasure by all who are favored with invitations.

Chrysanthemum Names.

Messrs. E. G. Hill & Co., have registered chrysanthemums as follows: Abbe Mendenhall, C. B. Whitnall, Dr. R. B. Covert, Fred Dorner, John F. Miller, James Morton, John Bertermann, Joey Hill, Judge Hoitt, Mrs. Louis Childs Madeira, O. P. Bassett, Vesuvius, W. G. Newitt.

EDWIN LONSDALE.
Sec'y Am. Chrysanthemum Society.

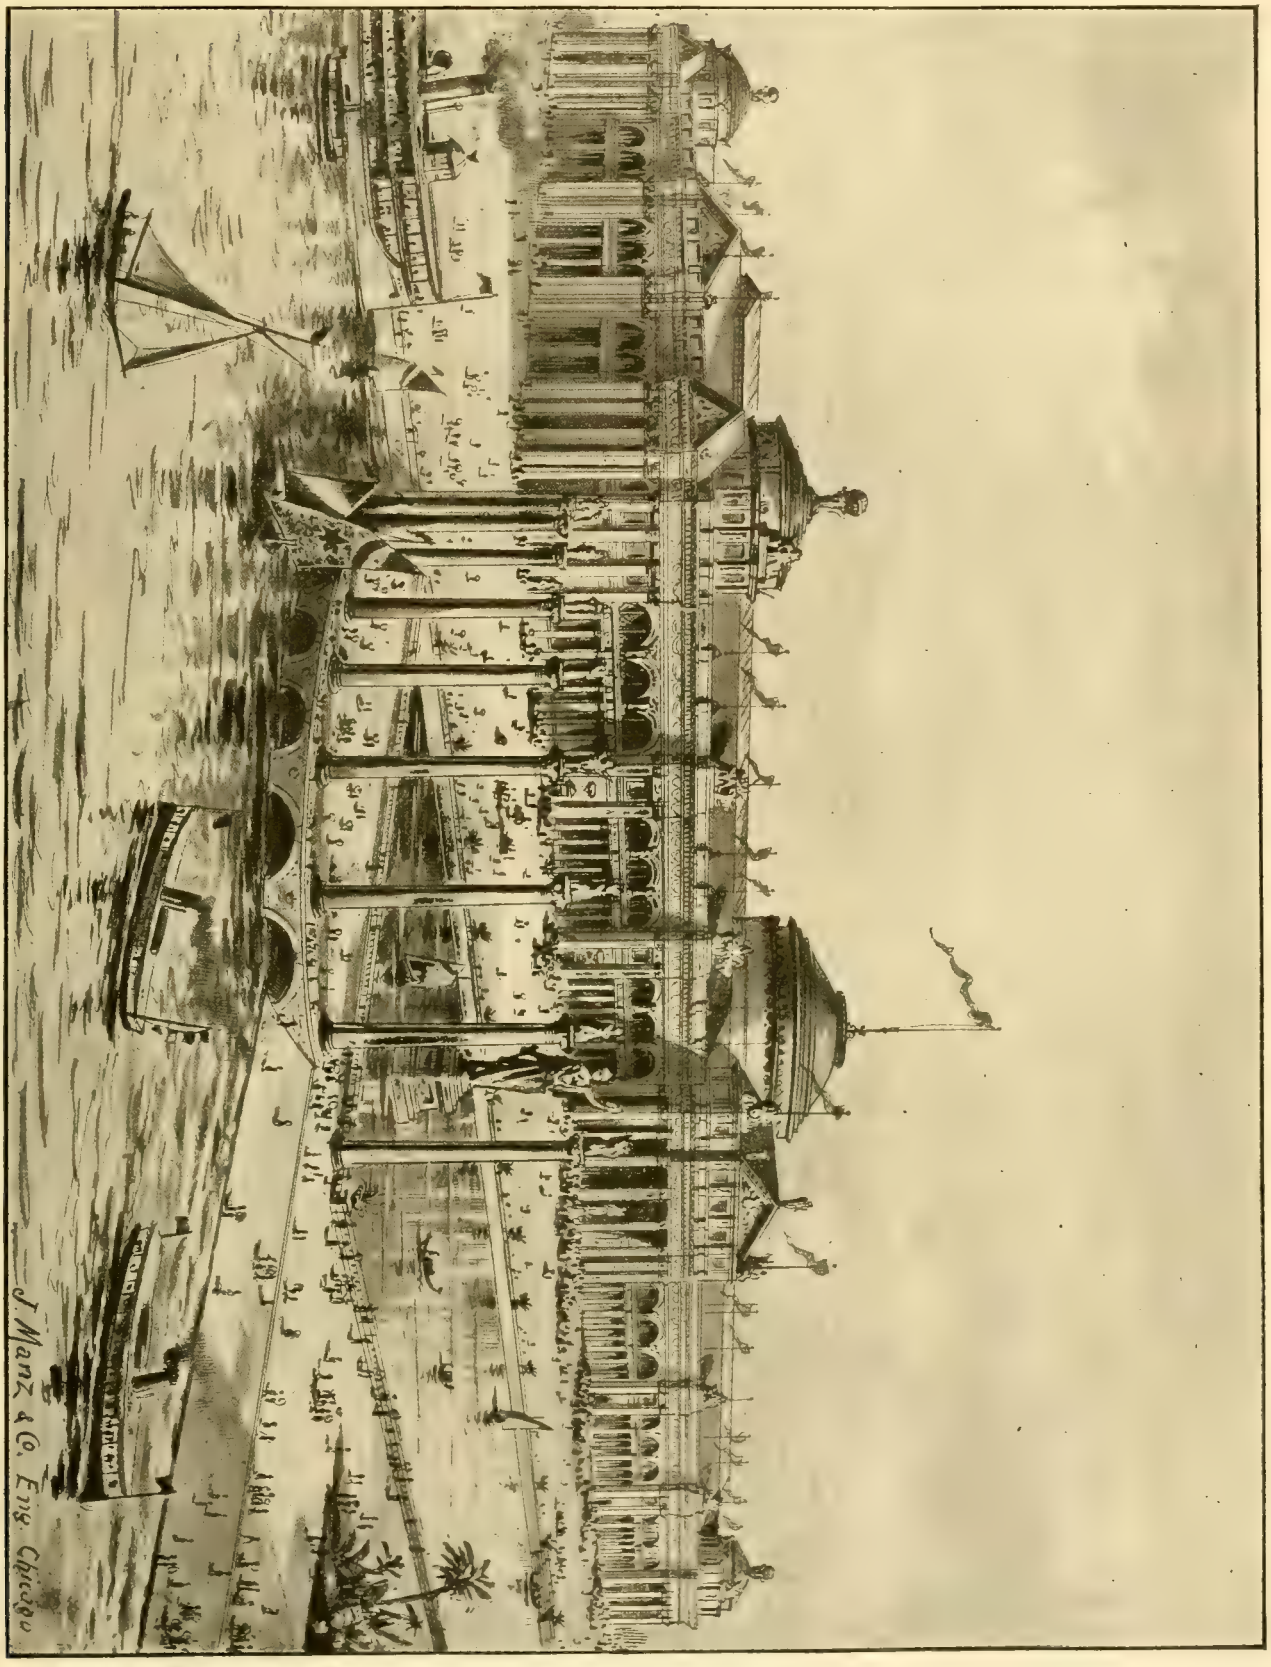
News Notes.

AUSTIN, ILL.—Jos. Shaw has sold out to Josephine Barnebee & Co.

OSAWATOMIE, KANS.—L. W. Jacobs has added two new houses, one 50x18 and the other 50x9.

PITTSBURG.—Business has been very brisk of late: One firm—A. M. & J. B. Murdoch—had three large wedding decorations and one banquet in one week.

RACINE, WIS.—Florist F. Fountaine will make a display of chrysanthemums Thursday and Friday of next week and in addition will award $25 in prizes to amateur competitors.



ST. JOSEPH, MO.—Trade has been lively of late and some of the time the demand has exceeded the supply. Stock is all in fine condition, especially roses. Chrysanthemums are a week later than last year.

HAMILTON, ONT.—The Gardeners' and Florists' Club began the new year with a small balance on the safe side, and the members hope to have an interesting time the coming winter. Mr. F. G. Foster has opened a down town store on King street west. Business very fair at present.

SAN FRANCISCO.—At the November meeting of the California State Floral Society there will be presented papers upon "Choice flowering shrubs in Golden Gate Park," "Bulbs" and "New roses and carnations." The meetings of this society are uniformly interesting and it is accomplishing much good.

BIG RAPIDS, MICH.—Florist L. L. Blair and the Ladies' Monument Association will give a chrysanthemum show here November 10, 11 and 12. The ladies will supplement the attractions of the exhibition by singing and dancing, and the admission price is only 15 cents. This is the second annual exhibition of this kind.

INDIANAPOLIS.—The fifth annual meeting of the Society of Indiana Florists will be held in this city November 11 and 12, during chrysanthemum show week. An excursion rate of one fare for the round trip has been secured from the railroads

THE AGRICULTURAL BUILDING FOR THE WORLD'S COLUMBIAN EXPOSITION AT CHICAGO IN 1893.

in the state, on account of the chrysanthemum show. The annual meetings of the society will hereafter be held in November during exhibition week, instead of in January, as heretofore.

Agricultural Building at the World's Fair.

We present herewith an engraving of the Agricultural building for the World's Columbian Exposition, at Chicago, in 1893.

With the exception of the Administration building, the Agricultural building will be the most magnificent structure on the exposition grounds. In size it is 800 by 500 feet, severely classic in style. It is almost surrounded by lagoons. The features of this building are its five pavilions, one at each corner and one in the center. The corner pavilions are 64 by 48 feet. The grand entrance is on the north. It is 60 feet wide, leading into a vestibule 30 feet deep and 60 feet wide. At the entrance are Corinthian columns, 5 feet in diameter and 40 feet high. Beyond these massive columns is the rotunda, 100 feet in diameter, surmounted by a glass dome 130 feet high. There are eight minor entrances, 20 feet wide.

AND NOW come the exhibitions. Nearly every one of the larger cities in America will have an exhibition of chrysanthemums and other plants and flowers this week or the week following. That these exhibitions, so widely distributed, will vastly increase the interest in flowers in every part of the land, and consequently advance the best interests of the trade, none will doubt. The reporting of such a large number of exhibitions, coming nearly all at the same time, will be difficult, but the FLORIST will undertake to give at least condensed reports of all in the next two issues.

THE MANAGERS of the Madison Square Garden Chrysanthemum show at New York found it expedient to change the conditions regarding the entries for "Best seedlings, never before exhibited" to one or more blooms of each instead of six, as per schedule.

AN adjourned meeting of the American Carnation Society was held at the St. James Hotel, New York, Wednesday, the 4th inst., to perfect the organization begun in Philadelphia. A full report of the proceedings will appear in next issue.

WHEN writing to advertisers please mention the fact that you were induced to write by the advertisement in the AMERICAN FLORIST. You will benefit us by letting advertisers know that it is the FLORIST that is bringing them trade.

YOU OUGHT to have the number of feet of glass in your establishment correctly given in the forthcoming corrected edition of our trade directory. To insure this accuracy send us now a written statement over your own signature.

WATCH our list of coming exhibitions. The changes recorded in this issue are almost as numerous and radical as last week.

SITUATIONS, WANTS, FOR SALE.

Advertisements under this head will be inserted at the rate of 10 cents a line (seven words) each insertion. Cash must accompany order. Plant advs. not admitted under this head.

SITUATION WANTED—By a German, middle aged, single and sober, some experience, want work in greenhouses only. Address F K, Springfield, Ohio.

The Seed Trade.

AM. SEED TRADE ASSOCIATION.

F. BARTELDES, Lawrence, Kan., president; A. L. DON, New York, secretary and treasurer. The tenth annual meeting at Hartford, Conn., second Tuesday in June, 1892. Applications for membership should be addressed to Wm. Meggatt, chairman membership committee, Wethersfield, Conn.

JAMES VICK'S SONS of Rochester are out with a circular as follows: "Do not let any reports concerning our temporary embarassment have the slightest influence. We are on a firm footing and are looking to our old friends and customers for their regular trade. We have been in the business all our lives and expect to continue as long as life lasts."

THE EMERSON SEED CO. and Phil Stimmel, of Omaha, have combined their growing departments, and will continue that branch of their business more extensively with an increased list of specialties.

IT IS REPORTED that no provision has been made for any of the creditors of Wm. H. Smith, seedsman, Philadelphia, except his landlord who has purchased his establishment.

VISITED CHICAGO: Mr. Charles Bates, of London; Charles P. Braslan, H. W. Buckbee, John P. Salzer and wife.

THE Nebraska Seed Co. succeeds to the retail business of the Emerson Seed Co. at Omaha.

THE AMERICAN FLORIST CO.

WILL PUBLISH A

CORRECTED EDITION OF THE

DIRECTORY

WHY You Should Grow Mushrooms.
Because they are the most profitable crop for the outlay that can be grown and may be grown without interfering with other crops. The market is sure, the supply never having been equal to demand.

WHEN You Should Grow Mushrooms.
During the Winter and Spring months, the first planting in August or September with successional planting until April.

WHERE You Should Grow Mushrooms.
Under the greenhouse benches, on the greenhouse benches among growing crops, in Rose Houses, in frames in the greenhouse, in cellars, stables or outhouses, in the open field or in mushroom houses.

HOW You Should Grow Mushrooms.

First get spawn that will grow. It must be fresh, well spawned, and in good condition. **Gardiner's Celebrated English Mushroom Spawn** is the best, and is always fresh and reliable. The details of culture are given concisely in our treatise, **"Mushrooms for the Million,"** Mailed free. **Falconer's "Mushrooms and How to Grow Them."** Published at $1.50. (Gardiner's price $1.35 post free.) **Robinson's "Mushroom Culture,"** 50 cts. postpaid.

GARDINER'S ENGLISH MUSHROOM SPAWN.
John Gardiner & Co., have made a specialty of choice spawn for years, and their celebrated English brand (made by the best maker in England, specially for their trade), has gained an enviable reputation among critical growers for its uniform good quality, and can be thoroughly relied on to produce a good crop of the best mushrooms. Orders booked now for delivery as wanted, $8.00 per 100 lbs. Special rates to large growers. Address all correspondence to **21 North Thirteenth Street,** Philadelphia, Pa.

CATALOGUES.
I MAKE 'EM, WITH CUTS AND "KNOW HOW."
J. Horace McFarland,
..... HARRISBURG, PA.

Toronto.

Chrysanthemums are late here and high temperature is being resorted to by some to get the blooms into exhibition condition by the second week in November. On going the rounds yesterday I saw many fine buds that will not have reached perfection until weeks after the show is over. However for all that the prospects are good for the best show this town has yet seen.

W. J. Laing, who has a fine lot of plants, talks of having a little show at his own place during the first week in November, thereby advertising his own business and the big show of the week after.

J. H. Dunlop is building a substantial 35-foot brick chimney for his two steam boilers; the bother with iron was getting monotonous.

Messrs. Manton Bros. will reopen their store on Yonge street next week. Everybody who knows Tom Manton will wish him success.

My nose was directed to a bloom of carnation Miss Annie Wiegand yesterday and the strong spicy odor therefrom brought to memory some old country cottage garden where the old fashioned clove pinks abound.

W. H. Dale of Brampton, near Toronto, whose place was visited by many during the S. A. F. convention, will shortly open a wholesale flower store in the business part of the city.

Mr. R. Mearns of this city has some chrysanthemum plants and blooms which I venture to believe would be appreciated at the Madison Square show. He has some Mrs. Alpheus Hardy which are simply magnificent. "Eternal vigilance" has been Mr. M.'s motto and his stock shows that he has lived up to it. E.

About Smilax.

What is the cause of smilax leaves losing their color, in spots running with the veins? I. A. P.

THE MANAGERS of the chrysanthemum show at Indianapolis have gotten out a programme with a specially engraved cover, containing the premium list and the musical programme, the latter being printed on Japanese paper, each page decorated in color in Japanese style. Its odd character will undoubtedly induce the recipients to preserve it as a souvenir. The prices of admission have been arranged as follows: Days and Saturday evening, 25 cents; other evenings, 50 cents; children, 10 cents. A rate of one fare for the round trip has been secured from all the railroads in Indiana.

ORCHID FIBRE.

I beg to call the attention of orchid growers to a choice lot of orchid fibre, which without doubt is the best and cleanest quality in the market. Send for sample. Address

ROOTED CUTTINGS.

CARNATIONS AND OTHER STOCK.

I will devote some 30,000 feet of glass to Carnations this season, and will give my whole time and attention to the getting out of strictly first-class cuttings.

Of the three best Novelties of last season (GOLDEN GATE, HECTOR and LIZZIE McGOWAN) I have a extra large stock, and in the best of condition.

My Miscellaneous Stock will occupy some 7,000 feet of glass and consist of GERANIUMS, FUCHSIAS, COLEUS, ETC. It will be grown for me by Mr. D. K. Herr, and gotten up in better shape than if I were to grow both these and Carnations myself.

Give me a chance to figure on your orders. List on application. Satisfaction assured.

DAVID CLIFFE, Germantown, Philadelphia, Pa.

A MILLION ROSES.

When we say a million we mean just what we say. We are carrying the largest stock of Roses in America to-day. We believe we have the best assortment, and we know there are no better plants offered for sale. Mr. Wm. B. Reed of Chambersburg, Pa., after a visit to our place, said: "I saw on paper that you had a million roses and I called to see the reality, and I must say candidly that you have by far the finest stock of roses I have ever seen, and I have been to many of the leading rose establishments of the country. Your 2½-inch roses at 4 and 5 cts. are much better roses than I have been buying for 4-in. plants from other dealers. You have a right to advertise a million roses, and you deserve success."

THE SENSATION OF THE YEAR. **"WABAN"**
A RED MERMET. **THE NEW FORCING ROSE**

2½-inch pots, well grown plants, 12 to 15 inches high, well branched and matured, with healthy, clean foliage and strong, bright roots.

$1.00 PER DOZEN; $8 00 PER 100; $70.00 PER 1000.

WE HAVE **25,000** OF THIS VALUABLE FORCING ROSE. Send us $1.00 and add 10 cents for postage and we will mail you a dozen "Waban" that you will find are better plants than eastern firms charge you $2.50 per dozen for—a saving to you of $1.50 per dozen, an item you should not overlook.

We also offer from 2½-inch pots, grand plants, at $4.00 per hundred: **40,000 LA FRANCE, 40,000 DUCHESS OF ALBANY,** 20,000 Malmaison, 20,000 Meteor, 20,000 Jardins, 20,000 Mermet, 20,000 Bride, 10,000 Watteville, 25,000 Viscountess Folkestone, 10,000 Snowflake, Mme. Hoste, The Queen, Clotilde Soupert, Mme. Cusin, Cook, Sprunt, Niel, Comtesse de Frigneuse, Princess Sagan, Mme. Etienne, Papa Gontier, Bon Silene, Safrano, Ma Capucine.

G. de Dijon, $6.00; Queen of Bedders, $8 00; Am. Beauty, $8.00; Sunset, $5.00; Sappho, $5.00; Grace Darling, $5; Wootton, $4.50; E. Metz, $5.00; Duke of Connaught, $8; Dr. Grill, $5; Pierre Guillot, $6.

MANATEE, FLORIDA, October 26, 1891.

THE GOOD & REESE CO., Springfield, Ohio.

DEAR SIRS:—The Roses came in due time and were in perfect order. They are up to your usual good standard (the best we have ever purchased of northern florists), and are now growing vigorously.

Yours truly, REASONER BROS.

We have all the NEW VARIETIES of Roses and a complete line of florists stock of all kinds. We quote Chrysanthemums at $3.00 per hundred; fine plants of all the leading kinds to select from.

LOUIS UNVERZAGT,
SPRINGFIELD, ILL.
Please mention American Florist.

Milwaukee, Wis.

Flowers have been scarce of late, good roses especially so, but for the last few days they have come in in larger quantity and of better quality. The supply of good pink and scarlet carnations is far from satisfactory. Chrysanthemums are in market, and the improvement of this flower over previous years is quite marked. A few growers are selling all they have at just double the prices they received last year. The new rose, Mme. Pierre Guillot, has made its appearance and sells well.

The public seems to be taking considerable interest in our coming flower show, which is now being advertised. It is quite encouraging to any florist to overhear some of the conversations on the subject in the street-cars and on the sidewalk.

Mr. Haessler, who has been quite ill for some time, has recovered, and is now looking quite well and happy among his usual fine lot of chrysanthemums.

Ben Gregory has opened a new flower window on Milwaukee street, next to the postoffice.

Mr. Keeper's new plant is about completed and looks well, though it seems strange to see the long slope to the north. This is a new theory which is being advocated considerably of late—so was the overhead heating some time ago.

C. B. W.

CARNATION
GOLDEN TRIUMPH.

A Seedling of 1888. Makes a fine plant and gives beautiful flowers.

Also a pink Carnation named "DOROTHY," a seedling of 1888—one of the best.

ENGLISH BEGONIAS.
The unrivaled plant for Bedding as well as for Glass.

BOX'S CHOICE HYBRIDS are best wherever tried. H. C. Merriam, Esq., of Salem, writes to J. R. B. on 29th Sept., 1891: "I wish to express my delight in the Begonias you supplied to a firm of florists here, from which I have added many to my own collection, they are finer than any named varieties I have seen." The Elyria Weekly *Republic* of Ohio, reporting the display of Begonias and Gloxinias (supplied by J. R. B.) at Copes & Son's greenhouses says: "They are enthusiastically admired by all lovers of choice plants." Mrs Parks Foster asserts "that for a brilliant mass of bloom they excel anything of the kind she saw in Europe, where they make a specialty of these favorite flowers. The shades of color are gorgeous and most brilliant."

BEGONIA TUBERS ready for dispatch in November, the cheapest as well as the best on market.
Singles, BOX'S CHOICE HYBRIDS, all colors mixed, 1st size, $4.50 per 100; 2nd size, $4 00 per 100.
Sing es, BOX'S CHOICE HYBRIDS, in separate colors, viz: Crimson, Scarlet, Rosy Pink, White, Yellow, and Golden Orange; these 6 choice varieties assorted or separate, $5.50 per 100.
The same, extra selected for pot work, $8.00 per 100.
Doubles, BOX'S CHOICE HYBRIDS, mixed colors, 1st size, $12.50 per 100, 2nd size, $10.00 per 100.
Doubles, BOX'S CHOICE HYBRIDS, in 6 separate colors, $16.50 per 100; extra selected, $3.00 per 10.

BEGONIA SEED. The quality of Box's seed is far ahead of others; buyers discard other strains. J. R. B. has already booked orders for nearly $500 worth for November delivery. You can have packets of fixed quantities, mixed or in 6 separate colors, of either double or single, at 1, 2, or 5 dollars per packet. With this seed you can "get in" to advantage and raise thousands of tubers next season. An Indiana grower sends this line: "I have raised some grand Begonias from your seed."

BOX'S OTHER SPECIALTIES are GLOXINIAS, splendid mixed colors, chiefly spotted, $6 per 100; seed, $1 per packet. CALADIUMS, named sorts, $4 per 10. Achimenes $4 per 100. **MY ANNOUNCEMENT** on Begonias in the *Horticultural Advertiser* was posted on July 1st to 5 000 American florists—refer to page 5.

N. B.—Orders must all be prepaid and shipping cost covered. If you state your wants and leave selection to me I will give you full value for 5, 10, 20, 100 or more dollars and ship promptly. Catalogues free. Address ***JOHN R. BOX, Begonia Grower, CORYDON, ENGLAND.***

CHRISTMAS ROSES.
THE LARGE WHITE FLOWERING VARIETY.

Orders are now booked for fall delivery. Having the largest home-grown stock in the world, and in splendid condition, I can do them well. Last year the large size produced over seventy flowers. For several years they have given the greatest satisfaction to my customers.

Sold by Seedsmen.

A Practical Charity.

The custom observed annually in Boston of giving away free to all applicants the large quantities of plants which have done duty in the parks and public grounds is in every way worthy of commendation and imitation.

Great numbers of plants on public grounds and private estates in the vicinity of the larger cities are permitted to perish every fall, which might with a little thoughtfulness and a trifling amount of labor on the part of those in charge, be made the means of carrying untold comfort and cheer into many dark spots where pleasure is seldom found and comfort but little known.

It is nothing less than a great and practical charity, of a kind which is likely to be fully as effective as many more pretentious and loudly heralded schemes and it costs almost nothing. We commend it heartily, and hope to see the plan generally adopted wherever is is practicable. W.

Lilium Longiflorum.

How close can I plant Lilium longiflorum in a bed without crowding? If planted nine inches apart, would it weaken them any? M. R.

[If the bulbs are strong—7 to 9 inches or more in circumference—9 inches apart would be too close, but if they were only 5 to 7 inches, 9 inches apart would do. They should be planted 4 or 5 inches below the surface, and the ground above them covered with light litter. R. C.]

THE CHEAPEST AND BEST OF ALL.

FIR-TREE OIL

INSECTICIDE—soluble.

FOR PLANTS.—To make a solution for washing or cleansing purposes—Half-a-Pint of Fir-Tree Oil to ten gallons of water.

For Green and Black Fly, Thrip, American Blight, Wooly Aphis, etc.—Half-a-pint of the Fir-Tree Oil to two or four gallons of water, or two or three tablespoonfuls to the pint.

For Red Spider and Caterpillar—Half-a-pint of the Fir-Tree Oil to two gallons of water, or three tablespoonfuls to the pint.

For Mealy Bug, Brown or White Scale—Half-a-Pint of the Fir-Tree Oil to four or six quarts of water, four to eight tablespoonfuls to the pint.

For Mildew and Blight on Fruit or Foliage—Half-a-Pint of the Fir-Tree Oil to a gallon of water, or six tablespoonfuls to the pint.

Used with warm water it is quicker in its action than when cold is used.

Soft or rain water is necessary, and Applied in Wood, Tin or Pot Vessels.—Galvanized Iron Vessels must not be used.

FOR ANIMALS.—For Skin Diseases and Killing Vermin mix one part of Fir-Tree Oil with three parts of warm water and wet the affected part each day. In some cases it may be used stronger. For Ring-worm apply full strength with a brush each day.

FOR BIRDS INFECTED WITH PARASITES.—Put a tablespoonful of Fir-Tree Oil in one quart of warm water and dip the bird in it, taking care that its eyes are protected, hold the bird in one hand for one minute, then dip into clean tepid water; this may be repeated. If necessary a much weaker solution may be used with a spray producer.

Sold in Bottles and Tins.

Charity Exhibitions.

Is it wise for florists to combine with charitable organizations for the purpose of giving floral exhibitions and are the support and assistance of the fashionable patrons of public charities a sufficient return for the time and labor contributed by the florist toward making such schemes successful? While there has been an occasional notable exception, yet is it not true that the results of such combinations have usually been unsatisfactory at the time and unproductive of benefit afterward?

The rule in such arrangements has frequently been that all the profits, if any, should go to charity and any deficit is left for the florists to take care of. Why should there not be an equal division and equal responsibility?

The time for fairs is at hand. Every florist knows what that means. Merchants in every line of business know something about it, but no other industry on the face of the earth is so mercilessly levied upon in proportion to its ability and resources as is the florist's.

Why should florists do more than the rest of the community to assist public charitable enterprises? They are certainly no less generously inclined than their neighbors and may be as safely left to gauge their benevolence according to their own consciences. W.

Transatlantic Wit.

John S. was "garden carter" for Lord E. Once upon a time he had occasion to drive the head gardener to Manchester. On the return trip they managed to collide with a lamp post, which broke the gig, John's arm and the head gardener's collar bone. John was laid up for a few days. Upon his return he was met by the head gardener, who informed him that his services were no longer required.

"I dinna ken aboot that," says John. "If ye dinna ken when ye have a good man, I ken when I have a good maester."

John stopped there till he died.
